I think this was called GeoWorks or something like that. It was a
very good product, written in assembly, and worked on an 8086. There
was much interest in the OS at the time. A coworker was interested in
becoming a developer but Geo never delivered the developer's kit. He
believes this was the main reason it was a failure in the market.
Remember too that HP introduced New Wave then. I think GEM/3 was
available too.

I know not enough about Pentium and 68000 internals to discuss
those terms. However, I'll take a broader perspective. Are you saying
that the (circa 1979) 68000 is superior? Faster? More advantageous??
- Than a 64-bit Pentium? Are you prepared to go public with this
discovery? I do not know whether what you say is true about "more 32
bit registers" inside your 8Mhz 68000 over a Pentium, but I'll put my
money on the Pentium to whip the stuffing out of a 68000, regardless of
how many registers it has. Perhaps it is on that fact you should focus.

How does your 8Mhz 68000 crank out those ray traces? Probably
on par with a Pentium. I'm sure you can leave my DX2/66 in the dust,
since the floating-point capability of the 486 sucks the big one.

A lot of people flip on their machines and DOS boots up. They load their application or they stack Windows on top of DOS and they load their application. They perform whatever they need to do with their application. Their computer is made more useful to them because exactly the piece of software that they need, either to maintain compatibility with the PC at work, or a specialty application out of a HUGE library is available to them. When they are done, they turn off their PC. (OK, so they might play a game of DOOM) Their computer has served them successfully. They are not fanatic. They don't give a ____ about the internal registers. They don't care whether some fanatic believes their system to be "crippled" because their system does what they want it to do. It does this with the largest available software library, and it does this with the "Most Bang for the Buck." They are satisfied. Need I say more? They paid $1237 for their system instead of $4800. They buy some software (since its available for the PC), then a cheap second car. They still haven't spent $4800. They are happy!

Forgot to mention....I've been playing 8-bit Atari games all day
on my 486 with "PC Xformer 3.0." It's a 32-bit program written in 32-bit
machine language. Funny, despite what you say, it seemed to run quite
well on my 486/66. No, I must be lying.

3598. Geneva/Neodesk problem with opening windows

Newsgroup: comp.sys.atari.st
Date: 1994-11-22 01:54:57 UTC
From: smiller@farad.elee.calpoly.edu
Message-ID: <1994Nov22.015457.145394@zeus.aix.calpoly.edu>
Source record: 176409

Hi, I know someone from Gribnif reads this group, but if someone else could help me then so be it. :)

When I open a window from the HD or floppy the window extends outside of the screen like this :

```
-------------
| |
| |-----------------|
| |_________________|
| |
|_____________|
```

^ ^
physical screen outside the border of PS

I checked the defaulty .inf and neodesk .inf files and both say the screensize is 640X480 which is what I am using (PTC1426). The problem is that the scroller bars, etc are unavailable to use because the screen doesn't stretch out that far, however using the X2 button the next window is within the physical boundaries. What can I do to make all of the windows stay within the specified screen size?

Also, a bit off subject but are there any good PD games to be found that will actually run on a TT? I have found a few , but they are few and far between...

Thanks,

*steve

HELP!!!!!!!!!

I can't get my hermes uucp e-mail working! It doesn't help that there
are very few instructions on just how to set the thing up and a couple of
the docs are in German (which I don't speak/write...)

Can any1 help? I tried uupoint_l instead but that is the "light" version
and so I can't send which is no good for evaluation (I do actually
register shareware stuff =8-])

Any help would be most appreciated - at the moment I have to use an
online mail reader and it's a pain...

Please help?

Richard.

s > listed don't support VT 100 at all, FZDT is one and is no longe
s > and you need a Key to use all its features..
s >
This is true abou ANSI not equaling VT-100. But don't count FZDT
out so quick. I use it.. its the ONLY thing I use (tried STorm..
what a pain)... anyway I use Freeze Dried in ANSI mode on a Internet
system that is set to vt-100.. I have only one very small problem,
and that is Gopher.. its puts a "B" in front of everything, still
works just fine, just has the "B" there. Other then that everything
works to perfection! Not having the KEY is not that big of a deal,
without it, you can't use the .do files... and other small things
like that, but thats about all. Don't get me wrong a true VT-100
would be better.. but if one has FZDT don't be afraid to use it! :-)

```
] Why should it be made by Atari? Are all the PCs made by IBM today? And can
] _really_ say that Medusa T-60 with 68060 processor (yes, it _is_ reality!)
] isn't fast enough for you ?? Somehow I doubt that ;-) Especially, after
] I saw Calamus running on both Medusa T-40 (68040) and on a 486-66 PC (under
] Windows NT). Guess, which one worked _much_ faster..?
```

The thing is, PC's etc. are supported by a huge quantity of companies, Atari compatibles are supported by comparitively very few, and the Medusa is hardly a fully standardised machine, I've still yet to see the full specifications of the thing.

```
] This is getting serious, if the PC world has really brain-washed us to meas
] Atari computers on PC scale, don't you agree? If this goes on, soon we'll
] want a 786-PC because of its "raw power" - even though its OS and software
] don't necessarily run any faster than Atari TT.
```

If you want to buy a new computer these days, it's basically a PC clown, or nothing. A shame considering they are so bad.

```
] Disagree, if you want to - but somehow I feel that _we_ Atari owners lack
] self-confidence. We don't have guts to be satisfied - we only complain...
] :-(
```

After using Atari's for years, we just expect something better than what we get if we buy a PC.

```
] Don't surrender - fight back. Because otherwise all we'll have tomorrow wi
] be Windoze-PCs. And, I think, most of us bought an Atari because we really
```

What is a tiny user base like Atari owners going to do to fight back against the PC's? The manufacturers of the hardware/software couldn't care less what the customers want. They *tell* the customers what they want, and the poor old consumer assumes they must be correct....

```
] _did NOT_ want to buy a PC. That's something to think about, no matter wha
] kinds of 786-processors they develop. If we buy Atari-compatible machines l
] Medusa, we support Atari computing. Even if Atari itself didn't care...
] The PC world don't need IBM either, does it?
```

PC's are available in pretty much every computer store all over the planet, how many stock Medusas? People aren't going to buy them if they don't have a use for the particular features, look at the Falcon, it was marketed (ahem) on a larger scale than the Medusa, and it has virtually faded into obscurity already (shame, I'd be quite happy to own one). We'll just either have to stick with what we've got, or join the masses and buy the machines which aren't going to become obsolete any time soon. The dreaded PC-clone.

I can't be bothered, I've never needed anything more than my STe, so that's what I'll stick with! Sure, I wouldn't mind if it was a bit quicker, and if I can ever afford it, maybe I'll try & find one of these STe Ad-Speeds, and maybe even a graphics card which will give me at least a maximum of 640*480*256 on my SC1224 monitor (IS there such a beast!?). But, for what I use it for, it's fine.

3610. kid software

Newsgroup: comp.sys.atari.st
Date: 1994-11-22 08:38:21 UTC
From: meulenbr@prl.philips.nl
Message-ID: <meulenbr.785493501@cstw168>
Source record: 176435

Hi,

A few days ago I downloaded some new software from atari.archive for my (5 year old) twins. However, I have not been able to run programs like 1stmaths, deuce and trains on my TT using TOS 3.06 (even with 24 bit addressing effective). They start properly, but the cursor cannot be moved and the system locks up (no bombs). The programs run fine on my old 1040 ST (TOS 1.0). Does anyone have a suggestion on how to fix this? I fear that otherwise they'll end up in quarreling about who may use these programs.

Currently they are already familiar with the programs from kv_house, kv_me1st and the color program from fouryrs. (unfortunately some of the other ones are not useful, since we're not native english speakers).

They love these very much, so I would like to ask if anyone has additional .pi1 files for color.prg suitable for coloring (e.g. just a line drawing). Unfortunately I'm not really considered to be a creative person.

Furthermore they would also be interested in additional .dat files for kv_me1st. I've tried to send email to Ken Kressin, but never got a reply. A letter to the address mentioned in the .doc file came back with a note stating that it could not be delivered. If anyone has additional .dat files, a copy would be highly appreciated!

Thanks, on behalf of Ruud and Erik.

The program you need is called tar (!). There are a number of utilities
available for both TOS and MiNT. GNU TAR is probably the best, though.

However, if you have a UNIX system handy, you will almost certainly have
tar available anyway. The standard syntax for untar'ing is

tar -xvf whatever.tar

: Thanks.

Your university system should have tar on it. To extract the files use

tar -xvf <file>

replacing <file> with the file to process.

you can also get tar for the Atari's, I got it from Hensa's excellent Web pages
(I think the section was from the main page, called extractors, or something
like that) to use that just run the extractor (untar i think) giving the
filename at the dialog box.

From: 932907da@cent.gla.ac.uk
Message-ID: <932907da.785499785@cent.gla.ac.uk>
Source record: 176441

Can anyone help? I want to use my ST for reading/sending e-mail
via a manual modem. My ST is only 512k. Is there any software
which will allow me to do this.

Is it true that Demon access requires a 1 (or greater) meg machine?

Any help is appreciated.

Thanks.

Gareth Davies.

Whether MS-Windows looks better than GEM is IMHO a matter of taste.
Personally, I prefer GEM with a decent shell (i.e. Gemini 2) although
it lacks some features of Windows (i.e. iconifying of windows). But
I think GEM usage is much more intuitive (since it's much more Mac-like).
GEM seems also more user-friendly to me than X-Windows.

One of the problems with GEM is that there are no real guidelines by
Atari for the user interface. Something like Apple Human Interface
Guidelines is missing. (There are some "de facto" standards created
by the Atari user community, I know. It's a shame that many programmers
don't stick to these standards.)

3620. Undeleting program

Newsgroup: comp.sys.atari.st
Date: 1994-11-22 10:40:59 UTC
From: Adrian Bridgett <apb25@cam.ac.uk>
Message-ID: <3ashrr$qra@lyra.csx.cam.ac.uk>
Source record: 176439

Does anyone know of a good undeleting program:
-fast
-works with 32MB paritions
-works with BGM partitions
-can undelete folders

I am using "undelete" which comes with KnifeST
but it is horrendously slow and cannot undelete
folders. Neither am I sure that it works on
32MB partitions.

Thanks for any help

The one I use is the Atari checkdisk 3, it has a file recover option
and is easy to use...

If you files were on a clean unfragmented partition, then you should
be able to recover them...

By the way it will be slow, there is no other way....

>ones....

It is *NOT* a pirated copy!!! I have two copies of it. One I bought
separately and the other was part of a compilation.

I'm pretty sure the manual says this will happen anyway. I can't remember
the exact words, but the idea of the game is that Blood is dying and
needs to find the "numbers" (clones of himself) so he can zap them on his
ship, and so live a bit longer. If you wait long enough Blood gets in a
pretty bad state. If you wait a *really* long time, his hand shakes so
much you can't control it at all....

Maybe, although the current (4.02) release of NeoDesk is greatly improved.
It hasn't crashed on me yet, the only real problems are that it gets the
window colours wrong (displays white on white sometimes!) but there is a simple
workaround. Gribnif know the problem, and have promised to fix it in the
next release.

>It [Ease] is just as powerful as Neo 4 IMHO ...

> windows stay within the specified screen size?

Seems that you somehow saved the initial window size (for the first
NeoDesk window opened) to be larger than the screen. The solution is to
drag the window off the left edge of the screen (yes, Geneva and NeoDesk
let you do this, but you have to toggle to appropriate FLAG in Geneva to
allow it). Then you can resize the window.

The other way to press the keyboard equivalent for the full size button
(check your Geneva Task Manager for the appropriate key), which will make
the window the size of the screen.

3632. v23INF1: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1994-11-22 13:32:51 UTC
From: avg@cwi.nl
Message-ID: <Czo8Ar.8MM@cwi.nl>
Source record: 176307
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

Submitted-by: avg@cwi.nl (Annius Groenink)
Posting-number: Volume 23, Info 1

This article is posted twice a month. It gives a short introduction to comp.binaries.atari.st and describes how to submit binaries to the group.

I am always looking for suggestions on how to improve the usefulness of the newsgroup, and can be contacted at the following internet address:

avg@cwi.nl

Annius Groenink, Moderator.

ABOUT comp.binaries.atari.st

The moderated usenet group comp.binaries.atari.st contains publications or announcements of binary packages for Atari TOS computers. The publications on comp.binaries.atari.st may be freely distributed as long as no modifications are made to the packages. The packages may contain public domain software, shareware or demos of commercial programs.

THIS IS A MODERATED GROUP. YOU CANNOT POST TO IT BY YOURSELF. Read the instructions below for submitting material intended for publication on comp.binaries.atari.st.

SUBMITTING BINARIES FOR PUBLICATION

Items intended for posting or queries and problem notes should be sent to avg@cwi.nl. If you are on a UUCP-only site, you can send them to uunet!cwi.nl!avg. Note that comp.binaries.atari.st is not the correct place to ask general questions or to ask, "Does anyone have software that does X?" Post such requests to comp.sys.atari.st or comp.sys.atari.st.tech.

If you want verification of arrival, say so at the beginning of your submission, or in a cover note. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while, or be rejected outright.

Please include a description of your program at the top of your article. Look at old issues of comp.binaries.atari.st for examples of the sorts of descriptions I'm looking for. In general you should indicate what the program does, on what types of Atari TOS computers, whether your program requires a certain amount of on-board memory, a hard disk or a certain screen resolution. If necessary, I may rewrite or add to this information in order to make the postings to the group more uniform. I can't check your submission in all possible configurations, and see what works and what doesn't. Without a description, your submission is likely to be rejected.

If possible, submit your binaries in a Zoo 2.1 archive. I will generally check that everything in the archive is OK and that the files in the archive make sense on an ordinary Atari ST system (i.e. they are MS-DOS style files), unless the archive is specifically intended for use with an alternative file system such as Minixfs. If necessary, I will re-pack the binaries using Zoo 2.1.

If you are submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. But feel free to post demo versions. Submissions which I feel are of an excessively commercial nature will not be posted.

THE STRUCTURE OF COMP.BINARIES.ATARI.ST ARTICLES

There are two types of articles in comp.binaries.atari.st: "information postings" and "binaries". The binary postings are also called "Issues". The postings of type 'announcement' (history has only known 1) are no more supported, as we now have a group comp.sys.atari.announce for those. The type of a posting can be distinguished by the subject line:

Subject: v06INF1: Introduction to comp.binaries.atari.st

This first word in the title identifies this as the first info posting of volume six. Similarly, the subject line shown below:

Subject: v20i081 (binary): deadwrtr -- Ouija-word processor part01/01

identifies this as the 81st issue in Volume 20, and it's a binary posting. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v20i041 (binary): pet -- CBM PET emulator part04/39

The "References:" line, if present, points to the previous part of a multi- part program, so that newsreaders (trn, tin, nn, etc.) which can

follow threads will recognize a large program as a single thread.

The first few lines of an article's body are auxiliary headers that look like this:

```
Submitted-by: jackt@atari.com (Jack Tramiel)
Environment: high resolution, tt
Posting-number: Volume 19, Issue 80
Archive-name: rsn
Supersedes: atw: Volume 10, Issue 10-15
```

"Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site. This will usually be the same as the "From:" line in the article's main header.

Certain information about the system configuration required to use the program is given on the Environment: line.

```
Environment: 1meg, medium res, high res
```

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory. Examples:

```
high - runs in high resolution (monochrome)
medium - runs in medium resolution
low - runs in low resolution
1meg - needs 1 meg of RAM
ste - requires an STe
tt - requires a TT
```

The "Posting-number:" line repeats the volume/issue information for the aid of notes sites and automatic archiving programs.

The "Archive-name:" is the "official" name of this program in the archive. Large postings will have names that look like this:

```
Archive-name: desktop/part01
```

The "Supersedes:" header line, if present, indicates that the program replaces an earlier version.

REPORTING AND TRACKING BUGS AND PATCHES TO POSTINGS

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-by header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

HOW TO OBTAIN OLD ISSUES

There is currently no officially documented archive for this group.

3633. What is MAC SIMM for FALCON?

Newsgroup: comp.sys.atari.st
Date: 1994-11-22 14:15:40 UTC
From: s925377@mailserv.cuhk.hk
Message-ID: <s925377.56.2ED1FD0C@mailserv.cuhk.hk>
Source record: 176336

I have just read from ST application (UK):

Gasteiner Technologies have announced the immediate availability of a 14 Meg Ram card for the Falcon. I t uses a single 16 Meg Macintosh SIMM(although only 14 meg can be addressed on the Falcon) and fitsneslty inside the Falcon's casing wihtout the need to cut the shielding. The Ram card cost uk pound 499 but users can trade in their existing 4 meg memory module and get 100 off the price.

Does anyone know what is a MAC SIMM? Is it the 72 pins ram, the one also use for PC? Or is it the outdated 30pins simm?

If it is the 72 pins, then things would be easier since one can get 72pins all arouind the world easily. And should be able to use in the future.

==========
Please mail to me directly if possible.
Good Luck!

Malcolm

>(yes, even with caching, etc on - DOS just can't do sensible disk
>access).

>Running Linux on the other hand, you get full power out of such a machine.

I agree - we have loads of PC's at work, and they all run Windows. Not
small PC's - large, expensive, fast PC's (486DX2/66 and up). And I still
have to sit & wait for them to load things, watch while the system sits
still at random points, cry when it crashes, etc.

But one day, a guy at work fetched in his Linux CD to show the boss - wow,
the speed was incredible. Connected to out Sparc20 fileserver (just like all
the Windows PC's) it was faster in use than our other Suns. Add the virtual
screen driver (as fast & smooth as MonSTEr), and it's a genuine shit hot
workstation. I can honestly say after that, that PC's are blisteringly fast,
but running Windows (as most do) they are slower top use than an 8MHz ST.

Compare Calamus (even the old 1.09) to ANY windows DTP system, and you'll
see what I mean.

Of course, once Linux68K has it's X server going, we'll be able to do
a proper head to head (same OS, both platforms), and really see how much
the architecture slows down things in the real world (rather than the how
many MIPS benchmark world).

From: hutch@ilmen.lanl.gov
Message-ID: <9411221500.AA02401@ilmen.lanl.gov>
Source record: 176322
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,misc.forsale.computers.other,rec.games.video.atari

ATARI LYNX (color hand held game console) for sale:

My son wishes to sell his Atari Lynx complete with 4 or 5 game cards,
com-link cable, car cigarette lighter power adapter, etc. It's in
good condition and works just fine.

We are only looking at about $50 plus shipping so it's a good deal.
Would make a great Christmas present for kids (or yourself).

Sorry that I don't have the game titles with me right now but I'll
round those up tomorrow for anyone interested via email.

Sorry for the crossposts but I wasn't sure where to put this.

s > and you need a Key to use all its features..
s >
This is true abou ANSI not equaling VT-100. But don't count FZDT
out so quick. I use it.. its the ONLY thing I use (tried STorm..
what a pain)... anyway I use Freeze Dried in ANSI mode on a Internet
system that is set to vt-100.. I have only one very small problem,
and that is Gopher.. its puts a "B" in front of everything, still
works just fine, just has the "B" there. Other then that everything
works to perfection! Not having the KEY is not that big of a deal,
without it, you can't use the .do files... and other small things
like that, but thats about all. Don't get me wrong a true VT-100
would be better.. but if one has FZDT don't be afraid to use it! :-)

>for that damn missing key. Pretty boring.

I have to agree with this. I tired of Doom on the PC extremly quickly (Ultima Underworld is, IMHO, far superior). Aliens vs. Predators suffers from the same problem, too much action and very little intelligence. I hope something Dungeon Masterish comes out for the Jag RSN.

Those that have Jags have probably noticed that except for startup screens and such, everything seems to be done in 320x240 (approximately) instead of the full resolution, what a bummer. AvP is also *not* 24bit for the most part. It looks more like 8bit (look at the 'gradients' in the walls, rust spots etc... those would be extremely smooth in 24bit). Maybe the Jag can't really keep up with full-speed 24bit high-rez, or maybe they just didn't bother in AvP.

Just my 2cents worth...

Don't know, but 1 Meg upgrade is only 10 quid (STe) or 35 quid (STFM),
from ST Review magazine.

There is a large active Atari community on CIX, which gives full Email
access, and an Internet gateway.

A 486DX2/66 comes for 3000,- DM. A Medusa costs more than twice of this.
That's the problem. (And you can run a decent, rather bug-free OS on the
PC: Unix.)

U@> have a 520STfm and we have a 520ST (1 meg RAM!!!) and another 520ST
U@> (512k) which I had but never used.
U@>
U@> Is there any chance of upgrading TOS

Yes, very easy. Just get the new chips and plug 'em in.

U@> ...or any chips so maybe we could
U@> get it up to STe specs?

Now, that's a different matter. In a word, not a chance. [ok so that's 3 !]
But IMHO, you don't really want to go to STe level do you ? All that
incompatibility with the older software, etc.

U@> Is there any reason why Atari designated the 354 to be single sided
U@> and the 314 to be doule sided?

Dunno.

H@(> I'm looking for a used modem for use with my Atari STE.
H@(> Which ones work well and which ones don't with the Atari's?
H@(> I'm looking around in the "modems for sale" newsgroups, but
H@(> I have no idea as to what to look for. Thought I'd ask here
H@(> first.

As far as I know, there are none that have any problems working with
Ataris. Just make sure that it is capable of at least 9600 baud data
speed (*make sure it is DATA speed, as some modems are capable of
9600 for FAX, but can only handle data at 2400*).
Note: this is not an essential requirement, but you WILL get sick of
a 2400 baud modem because it is so s-l-o-w !
Make sure it has some sort of error correction protocol, has autodial,
autoanswer and is Hayes compatible (usual standard things for most
modems these days) and you should be ok.

> they showed the general English-only-reading public what it was like.

I agree 100%

> Mind-you, I ordered Neodesk 4 ages before the demo was available, go
> figure! :)

Me too, and I must admit I still prefer Ease, but I have notified Gribnif of the problems I found, and I am assured they will be fixed with the next update.

] My Atari 520 ST upgraded to a 1040 does not boot at all. The monitor
] shows nothing, but its on. My disk drive works but it is not receiving
] anything from the computer. Does anyone know what I can do to fix this?

Did it never work, or just stop operating one day?

Try lifting it about an inch above the desk and dropping it. It may sound
stupid, but it more often than not fixes the machine. (By shaking lose
any chunks of solder that may be bridging contacts, or re-seating
chips etc.) If it still doesn't work, then something is probably
fried, by the sounds of it, it's something to do with the RAM.

>Yes, indeed - several in fact.
Amazing Martin, can you tell us a few more details such as:

How many people are doing this?

What is the data rate?

Where is the net available?

Do you need a license to transmit?

What does the radio hardware cost?

Is there an Internet gateway?

Enough questions? :)

This sounds like the media change bug. I'm not sure if it is a software-only
bug (in which case a newer TOS should fix it), or if it depends on certain
drive mechanisms. Anyway, there is a file fmc.arc (force media change,
maybe lzh) on atari.archive.umich.edu (see the 0index file) that claims to
fix the problem. It should also have some text that discusses the phenomena
in depth, I would think. Good luck.

From: npetrlik@public.srce.hr
Message-ID: <3atqgr$oi6@nippur.irb.hr>
Source record: 176326

Hi !

I'm looking for GIF viewer for Atari STF (1M).
I'm not content with software that i have for that:
i've tried Photo Chrome 4 and Speed Of Light 3.0.
Photo Chrome 4 gives a good picture quality, but he's
slow (while processing) and not real time scrolling.
(if the picture is bigger than 320x200 for full
size (for example 720x480) i must pick a part
of picture for processing .. slow ..
Speed Of Light is a fast viewer, but has a bad
scroller (real time) and lower quality ...
but it's fast.

So, i'm asking You if somewherexists GIF viewer
with good quality picture and good scroller ?..

Thanx for any information,
Neven

If you drop an File onto the DESKTOP-ICON, you get the Filename in
the Commandline! This is so under "normal" TOS and also under MagiC.

>I have an EVNT_MULTI() loop running which receives the VA_START as a
>message but where do I find the file's name from?

VA-Start are used, when you (or another program) wants to give the name
of a file to an STILL RUNNING application.

Dropping a file onto the Desktop-Icon of your GFA-Shel causes to start
the shell and give you the name in the cml...

If an Application still runnung you can pass the Filename via VA-START...

>Does not this MEDUSA computer (or whatever) include a PC video card slot
>for these "terrible" video cards that you speak of??? I suppose it won't
>be a problem for a machine with the Fuji symbol on it, then?

The point is that almost every PC game runs in 320x200x256 because of the simple fact that the video card isn't able to put more than 64k of VRAM into the memory space the processor can access. I run a TSENG ET4000 card in my TT, which, by design of the ET4000 chip, can map the complete 800x600x256 into the processors memory space, on a PC this isn't possible because the VRAM is mapped as 1 Mb above the 1Mb system RAM in this mode. No PC I know of uses this technique. Any screen above 320x200x256 will have to swap 64k pages into the processors memory space, resulting in poor performance. (although the ET4000 card I use isn't speedy either, in a PC it is even worse) On a ST/STE/TT/Falcon the video ram is always a linear accessible space ('local bus' :-))

On the Medusa they use the same linear memory mapping system, so the choice of video cards will be restricted to only those cards that allow such memory mapping.

By concept the Ataris/Macs/Amigas are far more advanced than the PC's, on the PC's it's just patching up the old standards and put in faster and faster processors. Sysinfo programs rate the 486DX33 machines as being 4300 times the speed of an IBM PC, the videomemory has gone up from 4k to 1 Mb, this is 'only' 256 times greater, why isn't the screen whizzing about like the simpel text screens on a IBM PC 4.77 MHz ????? The answer is simple, bad design. Even the newest IDE drives mimic the old MFM controllers of the XT. Problem is, that even if you design something non standard for a PC, it quickly becomes one, just because of the thousands and thousands of users who buy such a (stupid) design. Look at the QIC tape streamers, these are just plain ridiculous (2 hours formatting a tape). Hooked up as parasites on a floppy controller, pretending being 250 Mb (=120 Mb)... Why not push SCSI streamers ? SCSI didn't become a standard on PC's as it did on Macs/Amigas/Ataris, why not ?
I bought a SCSI CD-ROM for about $300, for the PC you buy a so called IDE CD-ROM (don't try to hook it up to your HD IDE port though, because there

is no such thing as a standard IDE port) for less than $100.....

It's time that a new cheap and utterly good computer system is developed, just to shake the Microsoft/Intel monopoly.... Atari/Commodore/Apple all came close but not close enough.

If we go on like this, we'll be walking in Intel shoes, wearing Microsoft clothes... Naaaah, can't be true can it ?

Gert

I use AHDI 3.02 as I seem to recall the newer versions don't 'know' much about
these rather dated disk drives. You can use the newer versions of HDX though.

TOS upgrades are no problem. Neither are RAM upgrades. You can even fit
a blitter if you want. It won't give the extra graphics are sound of the
STE though. OTOH its probably cheaper to buy a second hand STE than upgrade
an ST too much.

> Is there any reason why Atari designated the 354 to be single sided
> and the 314 to be doule sided?

I always believed it was 5 in the 354 for 500k and 1 in the 314 for 1meg.

> goes on, soon we'll all want a 786-PC because of its "raw power" -
> even though its OS and software don't necessarily run any faster than
> Atari TT.

This is a comparison I thought I'd never have to do - but my PC will turn up at the end of the week and so I will see. My TT has more RAM and an FPU, but I sincerely hope the TT *thrashes* the PC. Actually even if it doesn't I still can't really lose.

> Disagree, if you want to - but somehow I feel that _we_ Atari owners
> lack self-confidence. We don't have guts to be satisfied - we only
> complain... :-(

I read in a magazine some years ago that high end machines (like the TT) had a much more significant value than pure sales. They inspired *confidence* in the ranks of ordinary ST owners. Knowing that serious people spent serious amounts of money on Atari equipment made then feel like the ST was taken seriously. Also these high end machines were an upgrade path which although 99% of ST owners were never going to take - still felt better because it was there.

This feeling has been lost IMO. Sure we now have the Falcon as well as the TT, but many people in this news group already have these powerful machines. Sure the Medusa is good - but how many have actually been sold? Also rightly or wrongly I suspect people feel a lot more wary about investing such large sums of money into Atari based equipment nowadays, *especially* from such a small 3rd part supplier.

> tomorrow will be Windoze-PCs. And, I think, most of us bought an
> Atari because we really _did NOT_ want to buy a PC. That's something

Also remeber that STs predate 'modern' PCs. In 1986 when I bought my ST, Windows was unheard of, and a powerful PC had a 12Mhz 286! The PC just wasn't a choice. I couldn't have afforded one even if I had wanted one.

> computing. Even if Atari itself didn't care... The PC world don't
> need IBM either, does it?

But there has to be a certain inertia before the instigator can drop out. Without Atari - there is precious little money in the Atari economy for R&D. Also unlike IBM, Atari *didn't* make it easy for clone manufacturers to make ST clones.

> we get if we buy a PC.

We get something better. For us, that is.. I prefer Falcon over a 486, and I don't think that's silly at all. Would you buy a turbo-charged Wartburg, if you could buy an Opel too? Yes; that Wartburg 686 GTi would have a lot more horsepower, all the luxuries one can imagine, and everybody would buy one (of course; it's nice to have a Wartburg 686 GTi!). But it _would_ still be a Wartburg, under its cosmetic and technical changes... And horrible to drive, even if very fast! I think "better" means "better to use"?

> What is a tiny user base like Atari owners going to do to fight back
> against the PC's? The manufacturers of the hardware/software couldn't
> care less what the customers want. They *tell* the customers what
> they want, and the poor old consumer assumes they must be correct....

Simple: buy what _WE_ want - not what THEY want us to buy... Thinking that way, we'd all drive Wartburg GTi, drink Coke, and eat Mc Donald's stuff. It's ridiculous, if we don't have any freedom of choice. Well, we do have - whether we believe it, or not. We still have, but how long?

> PC's are available in pretty much every computer store all over the

> to own one). We'll just either have to stick with what we've got, or
> join the masses and buy the machines which aren't going to become
> obsolete any time soon. The dreaded PC-clone.

One has to start somewhere; Medusa and The Eagle (68040 machine, too) are only the beginning. And in some way, they're much smarter machines than "real" Ataris never were. They use graphics cards like PCs, and that forces programmers to use "legal" code. No more programs that can expect that "this machine has 640x400 monochrome graphics, I'm sure... Let's try. What? What is this? No screen memory where it should be?? More colors than 2??? HELP!"

And about the Falcon... Why do some of us think that Falcon "was" some kind of a disaster that came, saw and disappeared? Perhaps here in Finland things are a bit different - but _most_ of my friends use Atari, and most of them

(surprise) own a Falcon... I can easily count over 10 Falcons owned by people I meet regularily. And (again, surprise): I've yet to meet a dissatisfied Falcon owner. Yes, there are ones, too. But who do you want to believe? Do you think that I'm just one of those who "wasted their money on a useless computer, and now desperately want to prove themselves and the others that the thing isn't complete crap..." ?

I've noticed that most of people who dislike Falcon don't own one. Do you believe this? The bird _is_ easy to dislike at first sight; that clumsy box, only a 16-bit bus, 16 MHz, etc etc. But somehow it is a very charming computer to use... I've seldom seen people _in love_ with their computer, like many Falcon owners I know, are... Well, computing should be more than cold, hard numbers and business, too - shouldn't it?

> I can't be bothered, I've never needed anything more than my STe, so
> that's what I'll stick with! Sure, I wouldn't mind if it was a bit
> quicker, and if I can ever afford it, maybe I'll try & find one of

> me at least a maximum of 640*480*256 on my SC1224 monitor (IS there
> such a beast!?). But, for what I use it for, it's fine.

Glad to hear you're satisfied. I wouldn't change back to my old accelerated Mega ST 4, even though it had a much better keyboard and more CPU power. Instead, I upgrade this bird - make it a better, faster, prettier computer. It takes money and time, I know - but for me, computing is a hobby among the more serious stuff. This is fun, after all =-) ! Well, mostly at least..

Greetings,

Tommi

3682. Atari items FORSALE and WANTED

Newsgroup: comp.sys.atari.st
Date: 1994-11-23 01:42:02 UTC
From: daveh@netcom.com
Message-ID: <davehCzp622.IFA@netcom.com>
Source record: 176346

ST ITEMS FOR SALE / WANTED
----

o Spectra GCR with mac roms --- $180

Complete with box, manuals, disks and cables. This includes Mac OS disks and Mac manuals.

o SCSI 250M 1/4in Tape and 100Meg HD combo --- $320
This is a Wangteck tape drive that handles 250Meg 150Meg and 60Meg tapes. The HD is 100Meg Quantum. Both are installed in a Megafile case to match perfectly with a Mega ST. NOTE this unit has SCSI in and SCSI out but no host adapter. I can give details on how to obtain SCSI out from an ICD AdSCSI Micro (internal Mega HD) that requires no soldering or else you will need an ICD link or similar. I will even throw in an the external SCSI terminator that is worth about $50.

o Calamus SL. (Resent release DEC 94?) --- $150
Complete with manual box and disks. I have a few PD fonts on disk also.

o Atari Works and Speedo GDOS --- $55
No box but includes manual and disks.

o Migraph Hand Scanner with Touchup SW --- $65
Includes Touchup software and comes complete with disks, manuals and box.

I am looking for a few things for my setup, these include: 8Meg ram board for Mega ST, Graphics Card for the same or a processor accelerator. I might also be interested in a Falcon if one is going cheap enough. We can work out some sort of exchange if you have any of these.

Terms are prepay (I will trust a personal cheque) or COD and shipping will be extra.

Cheers,

Dave.

> A 486DX2/66 comes for 3000,- DM. A Medusa costs more than twice of this.
> That's the problem. (And you can run a decent, rather bug-free OS on the
> PC: Unix.)

In a way I think you're right, Cornelius. Most of us doen't use Unix (or even Linux), though.. So what's left is this: a fast PC with a very heavy, and not absolutely bug-free, slow OS. When doing some heavy counting (raytracing for instance), that requires lots of raw horsepower, a Pentium PC does have its advantages over any Atari in the same price class. 68060-Medusa is another story, though. It should have muscles enough to kick many P5 PCs in the ass - I don't know for sure..

But I don't think it's fair to compare Motorola and Intel-based computers side by side, using only PC benchmarks i.e MHz, megabytes, etc. It's the OS that counts. And TOS, though far from perfect, runs pretty nicely on much smaller machines than decent Windows-PCs are. One can multitask programs on a 16 MHz 68030 Falcon better than on a 486-33 PC with Windows. That counts too, I think. If we look at numbers (MHz etc..) most Atari, Amiga and even Mac computers are "losers". But they really don't _need_ that much hardware to work ok..

What do you think?

Greetings,

Tommi

Actually, if you use AHDI 6.061, it compensates for that. I
upgraded the Mega ST2 at work with AHDI 6.061 from AHDI 6.06 from
AHDI 3.02 (the reason for upgrading from AHDI 6.06 was that AHDI
6.06 took a VERY long time to let the hard drive autoboot. Anyway,
AHDI 6.061 flies. I really would recommend it.

I can appreciate your opinion. However, users have had over two years to see this program up and running. Also, there is a demo of the program that is wide open to explore the many facets of it. Personally, it just sounds like an easy way for someone to get rid of existing stock and not give a damn about those users who paid full or near full price. If we were talking about a program that was 5-10 years old, I may agree with you and others.

Yes, the power supply in my brothers Mega ST 1 also blew about a year ago. He almost got himself a new power supply. Fortunately I did some fault checking on it before he did. It turned out, that it was only a blown resistor, cost: 20 cents.

Try measuring at different points with a voltmeter with the power supply taken out of your computer but switched on. When the power supply starts working suddenly (when you touch a certain solder point with your probes, you can hear when it's working from the humming noise it starts to make then), then it's likely you have the same problem. Then check all the resistors in the vicinity. Maybe you're as lucky as my brother was.

I remember a little discussion on this golden oldie a few months back, I recently bought a Mega with some software and this game was among the disks shoved in the box... I remember reading about it for my old-old sinclair spectrum - and now i have it and can't remember what I'm supposed to do.

Does anyone have a clue? All that I can get is an openig screen of the 'house' with a dude knocking on my monitor screen and a little dog walking up and down the stairs... <CR> brings up a window to type into - what am I supposed to type, Ive tried the obvious "Hello" etc... nothing.

I know the basic concept of the game, there being little men in the puter etc, but how do i communicate with them.

The games like (c)mid80's and do activision even exist? <sigh>

Nothing is ever "for good". If they feel they can get back into the computer business and make it profitable, of course they will! All the harping is just what careful, intelligent readers have known since before the introduction of the Jag. Atari is concentrating all $$ on the Jag right now. They cannot afford to be in the computer business at the moment.

Hi. A lot of you go home for Thanksgiving and then have a break until January. I ask that before you go home, capture the following Jaguar Letter Writing Campaign text-file and print it out.

Do the writing on the airplane or whatever. Just take the time to write.

Thank you everyone and HAPPY THANKSGIVING!

The text-file will be called: Jaguar NOVEMBER Letter Writing Campaign.

Len

MagiC replaces the complete TOS. So it speeds up everything.

3697. Jaguar NOVEMBER Letter Writing Campaign

Newsgroup: comp.sys.atari.st
Date: 1994-11-23 05:46:10 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <3aukv2$22o@usenet.INS.CWRU.Edu>
Source record: 176216
Cross-posted to: rec.games.video.atari,rec.games.video.misc,comp.sys.atari.st,comp.sys.atari.advocacy

The following text-file is the NOVEMBER part of the 1994 Jaguar Letter Writing Campaign.

Some of you may think this is a waste of time because you think that companies aren't listening to what you have to say. If you feel this way, you are wrong. This is the ONLY way to let companies know that you want their games on the Jaguar 64-bit interactive multimedia system.

I don't know if many of you realize this or not, but since this campaign has taken place, things have been happening. One of the first companies that we have written was WMS Industries (Williams). Atari and Williams have made an agreement to make Defender, Joust, and Robotron for the Jaguar. These were some of the best games in the past and they will no doubt be hits in their new 3-D form.

Another company that we have written to thank for doing a great job with Wolfenstein 3-D and to encourage the company to do a great job with Jaguar DOOM is id Software. Do programmers work EXTRA hard knowing that people appreciate their work? Jaguar DOOM is getting incredible reviews and I wouldn't be surprised if our letters helped make it that good.

We are now hearing rumors about Mortal Kombat II for the Jaguar. Some people have claimed to know people that have actually played it on the Jaguar. Atari Corp. won't confirm it, but it is possible that all of the letters that we have written to get Mortal Kombat II for the Jaguar is actually working.

If we haven't actually seen results YET with all of the other letters we have written doesn't mean our letters aren't working. Letters from consumers asking for a company's product can really work on an executive's brain. If he has some extra capital coming up in the future and has to make a decision what to do with the capital, your letters will influence his or her decision. FACT: Letters make a difference.

And your letters are EXTREMELY important NOW. This is because it takes about ten months to make a game and get it to market. If companies sign to make games for the Jaguar now, we will all be playing that game by Christmas of 1995.

I also don't know if you all realize this or not, but a few minutes of your time now can result in Atari being around years from now. If these incredible games are available for the Jaguar by this time next year, the Jaguar will be the #1 selling game system in 1995. And if the Jaguar is the #1 selling system next year, Atari will be around for a long time.

But don't do it for Atari. Do it for yourself. Most of us kept posting messages to Usenet for the last few years when Lynx games were slow in coming.

We -never- wrote game companies asking them to make games for the Lynx.
The result was that not enough games were made for the Lynx and the Lynx didn't
take off like it should have. We now criticize Atari for the failure of
the Lynx just like we will be doing two years from now about the Jaguar IF
we do not write game companies now.

I urge you to write. The time is now. Don't think other people will write
because they won't. You have to take a few minutes from your already busy
life and write these letters. Yes, it is a pain. But it is something that
must be done.

Thank you. The following is the NOVEMBER portion of the 1994 Jaguar Letter
Writing Campaign. I will post the complete campaign in the next message.

Len Stys, 1994 Jaguar Letter Writing Campaign Organizer

Virgin Games
Spectrum Holobyte
Psygnosis
Origin Systems

>>>>>>>>>>>>>>>>>>>>>>>>>> Virgin Games <<<<<<<<<<<<<<<<<<<<<<<<<<

Virgin Games is already a Jaguar developer, so this letter is mainly to
thank the company and to encourage them to make more titles for the Jaguar.
Virgin is suppose to be making Cannon Fodder, Demolition Man, and
Dragon for the Jaguar. The company is also planning to make a CD-ROM game
called Creature Shock for the Jaguar.

Virgin Games is known for making a popular PC CD-ROM game called:
The 7th Guest. It has also made Land of Lore, Dune II, and
Indy Car Racing. It will also be releasing 11th Hour and Command & Conquer
for the PC soon.

The mailing address for Virgin Games is:

Virgin Games
18061 Fitch Avenue
Irvine, CA 92714

The following is a list of things in which you may want to say in your
letter to Virgin Games:

Dear Sir or Madam,

1) How you enjoy Virgin Games' games.
2) How much you enjoy the Atari Jaguar.
3) How you are really happy that Virgin Games is making games for the
Jaguar.

4) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
5) How you would like to see other popular games such as The 7th Guest
(and name a few) besides the ones the company is already making
for the Jaguar.
6) How you would like to see the Jaguar modem and network features used
in Virgin Games' software (OPTIONAL).
7) How you will run out and buy Virgin Games' games when they are
produced for the Jaguar.
8) Thank you to the person for reading your letter and for producing
games for the Jaguar.

You may also want to FAX Virgin Games by the phone number: 714/833-8717.

>>>>>>>>>>>>>>>>>>>>>>> Spectrum Holobyte <<<<<<<<<<<<<<<<<<<<<<<

Spectrum Holobyte is famous for their Falcon flight simulator game.
The game can even be played through the modem on PCs. Spectrum Holobyte
has just released Fields of Glory and is rumored to be working on
Falcon 4.0.

Modem games is something that a game system must have if it will be
successful in the future. And Spectrum Holobyte is well-known for their
modem games. Falcon 4.0 sounds like it would be perfect for the
Jaguar.

The mailing address for Spectrum Holobyte is:

Barry J. Folsom, President
Spectrum Holobyte
2490 Mariners Square Loop
Alameda, CA 94501

The following is a list of things in which you may want to say in your
letter to Spectrum Holobyte:

Dear Mr. Folsom,

1) How much you enjoy Spectrum Holobyte games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
4) How you would like to see Falcon 4.0 with voice-modem and networking
capabilities on the Jaguar.
5) How you would like to see Fields of Glory and other Spectrum Holobyte
games for the Jaguar.
6) How you believe Spectrum Holobyte games will be unbelievable when
using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Spectrum Holobyte games when they are
produced for the Jaguar.
8) Thank Mr. Folsom for reading your letter and for considering
producing games for the Jaguar.

You may also want to FAX Spectrum Holobyte by the phone number:
510/522-2138. But please keep in mind that sending a letter through
the U.S. Postal Service may be more effective.

>>>>>>>>>>>>>>>>>>>>>>>>>> Psygnosis <<<<<<<<<<<<<<<<<<<<<<<<<<

Psygnosis is a well known producer of video games. A few of Psygnosis'
popular games are Microcosm, Shadow of the Best II, and Puggsy. A recent
game is Hexx: Heresy of the Wizard. TThe company has also done Lemmings.

The mailing address for Psygnosis is:

Psygnosis
675 Massachusetts Ave.
Cambridge, MA 02139

The following is a list of things in which you may want to say in your
letter to Psygnosis:

Dear Sir or Madam,

1) How much you enjoy Psygnosis games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple
of Pysgnosis games).
5) How you believe Psygnosis games will be unbelievable when using the
graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Psygnosis games when they are produced
for the Jaguar.
7) Thank the person for reading your letter and for considering producing
games for the Jaguar.

You may also want to FAX Psygnosis by the phone number: 617/497-6759.

>>>>>>>>>>>>>>>>>>>>>>>>> Origin Systems <<<<<<<<<<<<<<<<<<<<<<<<

Origin Systems is a maker of many popular PC role-playing and action games.
The company is owned by Electronic Arts but may have freedom to develop
for any system it wishes. Some of the games that Origin makes are:
Ultima series (most recently Ultima VIII: Pagan), Wing Commander Privateer,
and just recently Pacific Strike. Origin will be also making Biforge
and Wings of Glory.

Since Origin Systems is a subsidary of Electronic Arts, there is no
specific person to write.

The mailing address for Origin Systems is:

Origin Systems
Attn: Production Teams
P.O. Box 161750

Austin, TX 78716

The following is a list of things in which you may want to say in your letter to Origin Systems:

Dear Sir or Madam,

1) How much you enjoy Origin Systems games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose two or three Origin Systems games).
5) How you wish the Origin Systems Production Teams will attempt to get these great games on the Jaguar.
6) How unbelievable Origin Systems games will be when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Origin Systems games when they are produced for the Jaguar.
8) A thank you to the person reading for reading your letter and for considering producing games for the Jaguar.

********** THANK YOU! **********

3698. 1994 Jaguar Letter Writing Campaign (complete text-file)

Newsgroup: comp.sys.atari.st
Date: 1994-11-23 05:55:06 UTC
From: aa399@cleveland.Freenet.Edu
Message-ID: <3aulg0$2hd@usenet.INS.CWRU.Edu>
Source record: 176217
Cross-posted to: rec.games.video.atari,rec.games.video.misc,comp.sys.atari.st,comp.sys.atari.advocacy

The following is the complete 1994 Jaguar Letter Writing Campaign text-file.
If you haven't participated in these campaigns, but wish to participate
now, you are encouarged to go through past months and write each company
mentioned a letter.

One letter you may wish to write is to Atari Corporation. It is good to let
Atari know that we are participating in these campaigns so they can take
steps to get these companies developing for the Jaguar.

Letters do work. But they only work if you write them and send them!
Do your part so that we can be playing some GREAT Jaguar games in the coming
years! Thank you!

****
********** SEPTEMBER, 1994 **********
****

Atari Corp.
id Software
WMS Industries Inc.
Capcom USA Inc.
Electronic Arts Inc.

>>>>>>>>>>>>>>>>>>>>>>>> Atari Corp. <<<<<<<<<<<<<<<<<<<<<<<<<<

First, we will first be writing Don Thomas, Jr. at Atari Corp. to let him
know that we are participating in these campaigns. No, we aren't writing
to annoy him. We are writing him so that Atari Corp. knows the magnitude
of this letter writing campaign. If Atari Corp. knows that five-hundred
people will be writing Dynamix in October, the appropriate person at Atari
can contact this company on becoming a developer for the Jaguar during
this time. Do not expect a letter from Don Thomas, Jr. We are not
writing him for a response. We are only writing him to inform him of what
we are doing.

Atari's mailing address is:

Atari Corp.
Attn: Don Thomas, Jr.
1196 Borregas Avenue
Sunnyvale, CA 94089

Place the letters: C.A.I.N. at the bottom left side of the envelope so that
Atari will know what it is for.

Please use the following form letter:

(date)

(your address)

Don Thomas, Jr.
Atari Corporation
1196 Borregas Avenue
Sunnyvale, CA 94089

Dear Mr. Thomas,

I am writing you to inform you that I will be writing the following
game companies to encourage them to make games for the Jaguar.
I hope that my efforts will help Atari Corp. to sign these companies
to make games for the Jaguar.

The companies I will be writing are:

September: WMS Industries, Capcom, Electronic Arts
October: Sierra On-Line, Dynamix, LucasArts, NovaLogic
November: Spectrum Holobyte, Psygnosis, Origin
December: QQP, Broderbund, Konami

Thank you for reading my letter and for recording the number of
people writing these companies.

Sincerely,

(sign your name)

(print your name)

>>>>>>>>>>>>>>>>>>>>>>>>>> id Software <<<<<<<<<<<<<<<<<<<<<<<<<<

The letter to id Software should thank the company for producing
Wolfenstein 3-D for the Jaguar, encourage them to make Jaguar DOOM the
best that they can make it, and to encourage the company to make
QUAKE for the Jaguar.

id Software's e-mailing address:

Jay Wilbur, CEO
id Software
Town East Tower
18601 LBJ Freeway
Suite 615
Mesquite, Texas 75150

The form letter to Atari Corp. is the only form letter that will be used
in this campaign. This is because companies do not take form letters as
seriously as those that are originally written.

The following is a list of things which you may want to say in your
letter to id Software:

Dear Mr. Wilbur,

1) How much you enjoy Jaguar Wolfenstein 3-D.
2) How much you like id Software.
3) Thanks for making Wolfenstein 3-D for the Jaguar.
4) How you would like to see the best graphics possible for DOOM
on the Jaguar.
5) How you would like to see four-player or more networking capability
for Jaguar DOOM.
6) How you are excited about Jaguar DOOM coming out this year.
7) How you would like to see QUAKE made for the Jaguar.
8) Thank you to Mr. Wilbur for reading your letter.

Another thing which you may want to include in this letter is concerning
the Jaguar resolutions. id Software is using a lower resolution on the
Jaguar because they want to get the game as quick as Jaguar Wolfenstein.
I, personally, do not care if Jaguar DOOM is as fast as Wolfenstein.
One suggestion could be to make two modes (just like on the PC). One mode
is for higher resolution and slower speed. The other mode is for a lower
resolution, but higher speed.

>>>>>>>>>>>>>>>>>>>>>> WMS Industries Inc. <<<<<<<<<<<<<<<<<<<<<<

As of September 14, 1994, Mortal Kombat II is not being produced for the
Jaguar. And Acclaim has no plans to produce Mortal Kombat for the Jaguar.
But next year, WMS Industries will be able to release Mortal Kombat II for
any game system that the company wishes to release it for. The time is
now to let WMS Industries know that we want to see Mortal Kombat II and
Mortal Kombat III for the Jaguar.

Mortal Kombat II is by far the #1 most wanted game for the Jaguar
according to the Most Wanted Games for the Jaguar list by CAIN Newsletter.
If this game is released for the Jaguar, the Jaguar will be the most
wanted game system.

The mailing address of WMS Industries Inc. is:

Louis J. Nicastro, CEO
WMS Industries Inc.
3401 North California Ave.
Chicago, IL 60618-5889

OK. I don't think I have to remind you that you should write as neat and
as professional as possible to get the best results. If you certify your
letter, you may even reach the president with your letter.

The following is a list of things in which you may want to say in your
letter to WMS Industries Inc.:

Dear Mr. Nicastro,

1) How much you enjoy Mortal Kombat II
2) How you like the games that WMS Industries makes.
3) How you enjoy the Atari Jaguar.

4) How you think the Atari Jaguar is the only game system that will do
the game justice.
5) How you will run out and get the game for the Jaguar as soon as it
is released.
6) How you would also like to see Jaguar be the first system to get
Mortal Kombat III.
7) Thank you to Mr. Nicastro for reading your letter and for considering
making Moral Kombat II for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>>> Capcom USA INC. <<<<<<<<<<<<<<<<<<<<<<<

Capcom is known for producing the Street Fighter II series of games.
The company is also known for producing games such as The Great Circus
Mystery Starring Mickey & Minnie Mouse, Demon's Crest, and Saturday
Night Slam Masters. The company also does conversions of popular titles
such as Wizardry V and Eye of the Beholder.

Super Street Fighter II Turbo is second only to Mortal Kombat II on the
most wanted games for the Jaguar CAIN Newsletter listing. If the game
existed for the Jaguar, it would no doubt sell a lot of Jaguars. But
Capcom is not making Super Street Fighter for the Jaguar and no plans have
been announced to do so in the near future.

The strange thing is that Capcom is making Super Street Fighter II Turbo
for the 3DO platform. The game will even have better graphics than that
on the SNES and Genesis. But this only means that if Capcom will make a
version of SSFIIT for a much higher-priced system than there is a chance
that the company will be willing to make a Jaguar version.

The mailing address for Capcom USA Inc. is:

Scott Smith
Product-Development Coordinator
Capcom USA Inc.
475 Oakmead Parkway
Sunnyvale, CA 94086

The following is a list of things in which you may want to say in your
letter to Capcom USA Inc.:

Mr. Smith,

1) How much you enjoy Street Fighter at the arcades.
2) How you like the games that Capcom makes.
3) How you enjoy the Atari Jaguar.
4) How you think the Atari Jaguar is the only game system that will do
the game justice.
5) How you will run out and get Super Street Fighter II Turbo for the
Jaguar as soon as it is released.
6) Thank you to Mr. Smith for reading your letter and for considering
making Super Street Fighter II Turbo for the Jaguar.

You may also want to FAX Capcom USA by the phone number: 408/774-3995. But sending mail through the U.S. Postal Service may prove to be more successful.

>>>>>>>>>>>>>>>>>>>> Electronic Arts Inc. <<<<<<<<<<<<<<<<<<<<<<

Electronic Arts is the publisher of some incredible games such as: NBA Showdown, FIFA International Soccer, PGA European Tour Golf, NHL Hockey '94, Wing Commander, Super Wing Commander, John Madden NFL Football, Escape from Monster Manner, Twisted, Mario Andretti Racing, MLBPA Baseball, and many more! Electronic Arts also owns several other software companies that they may give the OK to develop the Jaguar for if they see there is a demand for Jaguar games.

Unfortunately, Electronic Arts is also a major backer of 3DO, a company that is a big competitor of Atari Corp. Electronic Arts is spending a lot of time and money on making games for 3DO that it could be spending on the Jaguar.

There is hope though! Electronic Arts is a licensee. This means that the company has Jaguar developers units. Electronic Arts' management just has to give the OK to make games for the Jaguar.

The mailing address for Electronic Arts Inc. is:

Lawrence F. Probst III, President
Electronic Arts Inc.
1450 Fashion Isle. Blv.
San Mateo, CA 94404

The following is a list of things in which you may want to say in your letter to Electronic Arts:

Dear Mr. Probst,

1) How much you enjoy Electronic Arts games.
2) How you have been buying Electronic Arts games for your computers since the company was started (if this is true).
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) The games that you would love to slee on the Jaguar (choose two or three Electronic Arts games--I'm choosing John Madden NFL Football!).
6) How you believe Electronic Arts games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Electronic Arts' games when they are produced for the Jaguar.
8) Thank you to Mr. Probst for reading your letter and a thank you for considering producing games for the Jaguar.

****
****************************** OCTOBER, 1994 ******************************
****

Sierra On-Line Inc.
Dynamix Inc.
LucasArts Entertainment Co.
NovaLogic

>>>>>>>>>>>>>>>>>>>>>>>> Sierra On-Line Inc. <<<<<<<<<<<<<<<<<<<<<<<<

Sierra On-Line is a company that is well-known for their role-playing games such as their Space Quest and Police Quest series. The company is also known for their latest hits in the PC world: Gabriel Knight, Aces Over Europe, and Leisure Suit Larry VI. Sierra On-Line is planning to release their new title, Phantasmagoria, very soon.

Sierra On-Line is definitely a company that needs to be developing for the Jaguar if the Jaguar CD-ROM is to become used. If Sierra On-Line starts making games for the Jaguar CD-ROM, several other companies will make games for it as well.

The mailing address for Sierra On-Line is:

Kenneth A. Williams, President
Sierra On-Line Inc.
P.O. Box 485
Coarsegold, CA 93614

The following is a list of things in which you may want to say in your letter to Electronic Arts:

Dear Mr. Williams,

1) How much you enjoy Sierra On-Line games.
2) How you have been buying Sierra On-Line games for your computer since the company started making computer games (if this is true).
3) How much you enjoy your Atari Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see Sierra On-Line producing several Jaguar CD-ROM games.
6) The games you would love to see on the Jaguar (choose two or three Sierra On-Line games).
7) How you believe Sierra On-Line games would be fantastic on the Atari Jaguar.
8) How you will run out and buy Sierra On-Line games when they are made for the Jaguar.
9) Thank you to Mr. Williams for reading your letter and for considering producing games for the Jaguar.

In my letter, I will also be encouraging Mr. Williams to make games which have the option of using a keyboard with the Jaguar. A keyboard can be created for the Jaguar and Sierra On-Line could work with Atari Corp. to produce one for it. The use of a keyboard in role-playing games help children learn words. This is something that Sierra has gotten away from in PC games.

I'm also writing Sierra to release HOYLE Card Games for the Jaguar.
I love this game and it would be great to see a modem feature being used
in the Jaguar version of this game.

>>>>>>>>>>>>>>>>>>>>>>>>>> Dynamix Inc. <<<<<<<<<<<<<<<<<<<<<<<<<

Dynamix Inc. is a game company owned by Sierra On-Line. This game
company makes many wonderful titles for the PC such as: Betrayal at
Kronder, Aces of the Pacific, and Front Page Sports Football Pro.
The company is planning to release: Front Page Baseball, Battledrome,
LodeRunner: A Legend, MetalTech: Earth Siege, Alien Legacy, and an
excellent reviewed game called Aces of the Deep (submarine game).

Dynamix Inc. is making some real great games and these games would be
a very good addition to the present Jaguar game library.

The mailing address for Dynamix Inc. is:

Alan Higginson
Executive Vice-President
Dynamix Inc.
P.O. Box 978
Oakhurst, CA 93644-0978

The following is a list of things in which you may want to say in your
letter to Dynamix Inc.:

Dear Mr. Higginson,

1) How you enjoy Dynamix games on the PC.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose two or
three Dynamix games--I'm choosing Front Page Sports Football,
Alien Legacy, and Aces of the Deep).
5) How you believe Dynamix games will be unbelievable when using the
graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Dynamix games when they are produced
for the Jaguar.
7) Thank you to the person for reading your letter and for considering
producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>> LucasArts Entertainment Co. <<<<<<<<<<<<<<<<<<

LucasArts is famous for making games based on popular movies. The company
has also has several popular titles out for the PC. Some of these titles
are: Star Wars Rebel Assault, X-Wing, Indiana Jones and the Fate of
Atlantis, Monkey Island 2: Le chuck's Revenge, and Day of the Tentacle.
And if there is any truth to the rumor of a new Indiana Jones movie,
LucasArts will probably make a great game based on this movie.

The mailing address for LucasArts is:

LucasArts Entertainment Co.
LucasArts Games Division
P.O. Box 10307
San Rafael, CA 94912

The following is a list of things in which you may want to say in your letter to LucasArts:

Dear Sir or Madam,

1) How much you enjoy LucasArts games.
2) How much you enjoy the Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games you would love to see on the Jaguar (choose two or three LucasArts games).
5) How you believe LucasArts games would be fantastic on the Atari Jaguar.
6) How you will run out and buy LucasArts games when they are made for the Jaguar.
7) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

You may also want to FAX LucasArts by the phone number: 415/721-3344.

>>>>>>>>>>>>>>>>>>>>>>>>>>>> NovaLogic <<<<<<<<<<<<<<<<<<<<<<<<<<<<

NovaLogic is known for its high-quality games on the PC. The president and CEO, John Garcia makes sure each game title released is of the highest quality. NovaLogic is known for producing Comanche: Maximum Overkill (a game title that rated high on the Most Wanted Games for the Jaguar listing from CANI Newsletter). The company also produced WolfPack (a submarine simulator) and UltraBots. The latest and greatest game from NovaLogic is Armored Fist. This game is highly praised by reviewers that have seen it.

John Garcia is interested in producing modem games and networking games in the future. NovaLogic's games would be a great addition to the Jaguar game library.

The mailing address for NovaLogic is:

John Garcia, President
NovaLogic
19510 Ventura Blvd.
Suite 200
Tarzana, CA 91356

The following is a list of things in which you may want to say in your letter to NovaLogic:

Dear Mr. Garcia,

1) How much you enjoy NovaLogic games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple
of NovaLogic games).
5) How you believe that NovaLogic games will be even more fantastic when
using the graphics and sound capabilities of the Jaguar.
6) How you would like to see NovaLogic games that use the Jaguar
voice-modem and networking capabilities.
7) How you will run out and buy NovaLogic games when they are produced
for the Jaguar.
8) Thank Mr. Garcia for reading your letter and for considering producing
games for the Jaguar.

You may also want to FAX NovaLogic by the phone number: 818/774-0684.
Please consider writing NovaLogic through the U.S. mail first and then
FAX NovaLogic.

18061 Fitch Avenue
Irvine, CA 92714

The following is a list of things in which you may want to say in your
letter to Virgin Games:

Dear Sir or Madam,

1) How you enjoy Virgin Games' games.
2) How much you enjoy the Atari Jaguar.

3) How you are really happy that Virgin Games is making games for the Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see other popular games such as The 7th Guest (and name a few) besides the ones the company is already making for the Jaguar.
6) How you would like to see the Jaguar modem and network features used in Virgin Games' software (OPTIONAL).
7) How you will run out and buy Virgin Games' games when they are produced for the Jaguar.
8) Thank you to the person for reading your letter and for producing games for the Jaguar.

You may also want to FAX Virgin Games by the phone number: 714/833-8717.

>>>>>>>>>>>>>>>>>>>>>>> Spectrum Holobyte <<<<<<<<<<<<<<<<<<<<<<<

Spectrum Holobyte is famous for their Falcon flight simulator game. The game can even be played through the modem on PCs. Spectrum Holobyte has just released Fields of Glory and is rumored to be working on Falcon 4.0.

Modem games is something that a game system must have if it will be successful in the future. And Spectrum Holobyte is well-known for their modem games. Falcon 4.0 sounds like it would be perfect for the Jaguar.

The mailing address for Spectrum Holobyte is:

Barry J. Folsom, President
Spectrum Holobyte
2490 Mariners Square Loop
Alameda, CA 94501

The following is a list of things in which you may want to say in your letter to Spectrum Holobyte:

Dear Mr. Folsom,

1) How much you enjoy Spectrum Holobyte games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) How you would like to see Falcon 4.0 with voice-modem and networking capabilities on the Jaguar.
5) How you would like to see Fields of Glory and other Spectrum Holobyte games for the Jaguar.
6) How you believe Spectrum Holobyte games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Spectrum Holobyte games when they are produced for the Jaguar.

8) Thank Mr. Folsom for reading your letter and for considering
producing games for the Jaguar.

You may also want to FAX Spectrum Holobyte by the phone number:
510/522-2138. But please keep in mind that sending a letter through
the U.S. Postal Service may be more effective.

>>>>>>>>>>>>>>>>>>>>>>>>>> Psygnosis <<<<<<<<<<<<<<<<<<<<<<<<<<

Psygnosis is a well known producer of video games. A few of Psygnosis'
popular games are Microcosm, Shadow of the Best II, and Puggsy. A recent
game is Hexx: Heresy of the Wizard. TThe company has also done Lemmings.

The mailing address for Psygnosis is:

Psygnosis
675 Massachusetts Ave.
Cambridge, MA 02139

The following is a list of things in which you may want to say in your
letter to Psygnosis:

Dear Sir or Madam,

1) How much you enjoy Psygnosis games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the
future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a couple
of Pysgnosis games).
5) How you believe Psygnosis games will be unbelievable when using the
graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Psygnosis games when they are produced
for the Jaguar.
7) Thank the person for reading your letter and for considering producing
games for the Jaguar.

You may also want to FAX Psygnosis by the phone number: 617/497-6759.

>>>>>>>>>>>>>>>>>>>>>>>>>> Origin Systems <<<<<<<<<<<<<<<<<<<<<<<<<<

Origin Systems is a maker of many popular PC role-playing and action games.
The company is owned by Electronic Arts but may have freedom to develop
for any system it wishes. Some of the games that Origin makes are:
Ultima series (most recently Ultima VIII: Pagan), Wing Commander Privateer,
and just recently Pacific Strike. Origin will be also making Biforge
and Wings of Glory.

Since Origin Systems is a subsidary of Electronic Arts, there is no
specific person to write.

The mailing address for Origin Systems is:

Origin Systems
Attn: Production Teams
P.O. Box 161750
Austin, TX 78716

The following is a list of things in which you may want to say in your letter to Origin Systems:

Dear Sir or Madam,

1) How much you enjoy Origin Systems games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose two or three Origin Systems games).
5) How you wish the Origin Systems Production Teams will attempt to get these great games on the Jaguar.
6) How unbelievable Origin Systems games will be when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy Origin Systems games when they are produced for the Jaguar.
8) A thank you to the person reading for reading your letter and for considering producing games for the Jaguar.

****
********** DECEMBER, 1994 **********
****

QQP, Inc.
Broderbund
Konami
MicroProse

>>>>>>>>>>>>>>>>>>>>>>>>>>>> QQP, Inc <<<<<<<<<<<<<<<<<<<<<<<<<<<<

Many people are not familiar with QQP, but the company has released some pretty amazing games for the PC. Some of the games are: Solitaire's Journey, Merchant Prince, The Perfect General, Conquered Kingdoms, and their most recent--Origamo.

Most of the games that QQP makes either has to do with strategy or war. Strategy games are always popular, but war games have been restricted to PCs due to lack of a "save game" feature on video game systems. Jaguar can save games on its cartridges so this is no longer a problem in getting war games to home video game systems.

The mailing address for QQP, Inc. is:

QQP, Inc.
495 Highway 202
Flemington, NJ 08822

The following is a list of things in which you may want to say in your letter to QQP:

Dear Sir or Madam,

1) How much you enjoy strategy games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you love to see on the Jaguar (choose two or three QQP games).
5) How you would like to see these games make use of Jaguar's voice-modem and networking capabilities.
6) How you believe QQP games will be unbelievable when using the graphics and sound capabilities of the Jaguar.
7) How you will run out and buy QQP games when they are produced for the Jaguar.
8) Thank you to the person for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>> Broderbund Software Inc. <<<<<<<<<<<<<<<<<<<<

Broderbund Software is well-known for producing two games. The first game is a CD-ROM game called Myst. The second is the Carmen Sandiego series of games. The Carmen Sandiego is educational.

The mailing address for Broderbund Software Inc. is:

Edmund R. Auer, President
Broderbund Software Inc.
500 Redwood Blvd.
Novato, CA 94948-6121

The following is a list of things in which you may want to say in your letter to Broderbund:

Dear Mr. Auer,

1) How much you enjoy Broderbund Software's games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) How you would love to see Myst, Carmen Sandiego, and any other new Broderbund titles on the Jaguar.
5) How unbelievable Broderbund Software games will be when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Broderbund Software's games when they are produced for the Jaguar.
7) A thank you to Mr. Auer for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>>>>>>>> Konami Inc. <<<<<<<<<<<<<<<<<<<<<<<<<<<<

Konami makes several popular games. Among these are Double Dribble: The Playoff Edition, Lethal Enforcers 2, Batman the Animated Series, and a new game called Contra 4. The company has also made Rocket Knight Adventures, Teenage Mutant Ninja Turtles Tournament Fighters, Blades of Steel, Track & Field II, Top Gun: The Second Mission, and many others. Konami is also rumored to be developing Gradius for Sony's new PSX. Since Konami is already developing for other next generation systems, it may be more difficult to convince them to make games for the Jaguar. But Konami certainly does bring a lot of titles to a game system.

The mailing address of Konami is:

Konami Inc.
900 Deerfield Parkway
Buffalo Grove, IL 60089-4510

The folowing is a list of things in which you may want to say in your letter to Konami:

Dear Sir or Madam,

1) How much you enjoy Konami games.
2) How much you enjoy your Atari Jaguar.
3) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
4) The games that you would love to see on the Jaguar (choose a few Konami games).
5) How unbelievable Konami games will be when using the graphics and sound capabilities of the Jaguar.
6) How you will run out and buy Konami games when they are produced for the Jaguar.
7) A thank you to the person for reading your letter and for considering producing games for the Jaguar.

>>>>>>>>>>>>>>>>>>>>>>>> MicroProse Inc. <<<<<<<<<<<<<<<<<<<<<<<<

MicroProse is already developing Jaguar games so this letter will be mainly to thank MicroProse and encourage the company to make more of their games for the Jaguar. MicroProse is supposedly making Grand Prix, Gunship 2000, and possibly Star Trek: The Next Generation game. But MicroProse has made a lot of fantastic games for the PC that should really be made for the Jaguar. These include: World Circuit, Fleet Defender, Master of Orion, and Civilization. Civilization has already been made for the Falcon030 so it may not be too hard to convert the game to the Jaguar. Since Jaguar can save games on cartridge, it may be possible to make Civilization on the Jaguar. MicroProse is also making Across the Rhine, Colonization, and Masters of Magic.

MicroProse is indeed a very good company to have making Jaguar games. The quality has always been good and it would be nice for the company to make a lot of their games for the Jaguar.

The mailing address for MicroProse is:

Ronald J. Bueche, CEO
MicroProse Inc.
180 Lakefront Dr.
Hunt Valley, MD 21030-2245

The following is a list of things in which you may want to say in your letter to MicroProse:

Dear Mr. Bueche,

1) How much you enjoy MicroProse games.
2) How much you enjoy your Atari Jaguar.
3) How you are really glad that MicroProse is making games for the Jaguar.
4) How you feel that the Jaguar will be the video game system of the future due to its high-performance/low-price.
5) How you would like to see other popular games besides Gunship 2000 and Grand Prix be made for the Jaguar (name a few of your favorite MicroProse games).
6) How you would like to see the Jaguar voice modem and network capabilities used in MicroProse games. (OPTIONAL)
7) How you will run out and buy MicroProse games when they are produced for the Jaguar.
8) Thank you to Mr. Bueche for reading your letter and for making games for the Jaguar.

You may also want to FAX MicroProse at the phone number: 410/771-1174. But only FAX MicroProse if you do not have time to mail the letter or if you have already sent mail to the company.

****

3699. Best simms for STE upgrade?

Newsgroup: comp.sys.atari.st
Date: 1994-11-23 05:58:19 UTC
From: hellman@teleport.com
Message-ID: <3aullr$l9u@sandra.teleport.com>
Source record: 176219

Hello All,
What simms are needed to take a 1 meg STE to 4 meg? Is there anything
special about the installation? Is there any software follow-up needed?
Does anyone know of on-line instructions for the upgrade posted
anywhere?
Thanks for any help.
Walter

Hallo Mike,

shure, we have some ATARI-users in our Anwender Kreis Atari
Freiburg, Germany, using ATARI for packet radio.

Here is the email-adress I promised:

mayklaus@mibm.ruf.uni-freiburg.de

The name is Klaus May, he uses" DIGIPOINT", you may find it in
internet , FTP.
Klaus May is waiting for your contact,
good by, Werner

Gee, maybe because they can make money with the Jaguar, then re-enter with enough money to support their product. I'm not talking a few weeks here, petey. it could take a year or two before they even consider re-entering. And, as we all know, marketing is the most important part of computer sales. They could havce crap coimputers and a crap OS and sell billions of them. Look at Apple. And, they had good machines a great OS and didn't sell them before because of Marketing. It is comploetely in the air. I'm not saying they will, but it is exteemely foolish to not say that is could happen. But, then again, you are the king of fools, peter.

Well the thing that makes AvP superior to other games is the resolution on
the texturemapping. I suspect AvP is at least 16 bit look at the Z shading
(every pixel is shaded) but the original digitized picture may be 8 bit to
save some space. Look at the walls when youre close up. It doesn't get
blocky, that's what's good about AvP. Nice game though. Good atmosphere
once you get into it, but it is to easy.In article <CzoK82.FH6@isltd.insignia.com>,

Yes. However, I do have a feeling that SRC virtual resolutions eat more memory
than BlowUp ones. This is a feeling, mind. I haven't tested it.

>Do any of the PD VS programs work with it?
I haven't tried any. Do you know of any good ones?

>If you switch the
>CPU and BUS back to 16MHz can you run Blowup?
Unfortunately, no. The hardware mods prevent this. You can still sue BlowUp with
the 25 and 32 MHz synchro, but as soon as you switch to external sync, things
go crazy. One of this days I must investigate if disconecting the video part of
SRC modification re-enables BlowUp.

P.S. While I don't use virtual resolutions much, I *L*O*V*E* BlowUps screen
saver (because it speeds the machine instead of slowing it down).

For those without BlowUp, check out Turbo Veille, a falcon screen blanker
available as t_veille on ftp.cnam.fr

I am looking for Xavier Roche (sp?) author of turbo veille and Bird's wings.
None of the documentation I looked into lists where the author can be reached.

The reason I would like to reach him is I would like to translate the doc's
to t_veille to english so other people can use this great program.

Yes, it is a 72-pin 16MB (4Mbit x 32/36) SIMM. There have been a few
Falcon030 RAM boards available for months that already will do that,
though, so Gasteiner's isn't the only one.

For a standard ST, SPEED OF LIGHT is about the best you're gonna
find for what you want.

I've search everywhere (even in a big text about slang on Internet), but I
can't understand the sense of 'IMO' or 'IMHO' I often read in this newsgroup.
Sure it can be very easy to understand, but if someone can help me and explain
what it is...

Thanks !

>to come here for confirmation.

It's SORTA true. Atari isn't bothering itself with computer stuff
right now while it's focusing on the Jaguar, but that doesn't mean
they won't get back into it in the future. That's about the most
positive way of looking at it (i.e. don't EXPECT anything computer-
related from Atari in the future!).

> THX

You need to make sure you have an AJAX floppy controller chip in
your STE, feed it a higher clock signal (I think it needs a 32MHz
clock for that), and then write your own software to format and
use the drive (unless someone already has done so). In other
words, it's probably not worth bothering with.

The main.c file hints that fasttext should not be enabled on a Falcon
although this comment may be out-of-date.

Anyway, Simon might have meant:
CON=U:\dev\fasttext

That's just a guess, I don't use it myself because I have a feeling it
does not apply when GEM is running, or when a graphic card is
installed.

Atari Web Pages Latest News
~~~~~ ~~~ ~~~~~ ~~~~~~ ~~~~

Version 1.0
~~~~~~~ ~~~

Date 22/11/92
~~~~ ~~~~~~~~

by

Mark Stephen Smith
~~~~ ~~~~~~~ ~~~~~

================================================================================

Foreword
~~~~~~~~

Hello and welcome to the first news item on the Atari Web pages. This document
will describe the Atari Web pages as provided by Mark Stephen Smith and will
inlcude a list of the latest updates for the month. Each month I hope to update
this text with the very latest additions and news on the Atari Web pages.

Hopefully these pages will provide an invaluable service to their users, but
they are still at an early stage and developing all the time. As such any
feedback and support you may have for these pages is more than welcome, it is
infact encouraged. The more input I get from its users the better, as then I
will know what is good and bad about these pages and can change them
approproately in the hope of increasing their value to their readers.

Now on with the show.

================================================================================

What are the Atari Web pages?
~~~~ ~~~ ~~~ ~~~~~ ~~~ ~~~~~

These are a collection of pages covering all formats of the Atari. In these
pages may be found the latest news, reviews, software for downloading, and
various other information and links to other places of interest to Atari users.

I have tried to make the structure of these pages easy to follow and as
intuitive as possible but there is still a lot of work to be done yet.

================================================================================

How do I access them and what is the Web?
~~~ ~~ ~ ~~~~~~ ~~~~ ~~~ ~~~~ ~~ ~~~ ~~~
```

First of all I shall look at what the Web is or to use its full name the World Wide Web. The Web is new way of accessing the Internet, unlike previous methods where you were required to enter commands into the program you were using the Web uses a more user driven method of getting around the Internet. This method is much more graphical than former methods and as such is much easier to get to grips with.

When using a Web browser (the name given to a program used to access Web pages) the control method usually consists of a point and click operation. A Web page will consist of text and graphics which are sometimes highlighted in some way to indicate that they are selectable and link to more information or a particular piece of data.

Such a link is reffered to as a hyperlink. In fact the whole system is a variation on hypertext and uses a script to create each page. Each script is written to a HTML (HyperText Markup Language) standard which contains the main body of text in the page and a few command tags for the browser as to how to format the page and what to do with links, etc.

Web pages may contain text, graphics, sounds, and animations, although the later two are normally supported through external software. It is also possible using the Web to gain access to newsgroups, ftp sites, and gopher services all through the one program. As such this makes this a very powerful tool for Internet access, and coupled with its ease of use this has suddenly became the big thing in the recent Internet explosion into the media.

Browsers can handle all properly written HTML scripts but may vary in operation when scripts are incorrect or contain mistakes. Browsers can be divided into to distinct types, graphical and text only. Popular graphical browsers include NCSA's Mosaic and the recent new browser NetScape. On the text side Lynx is the most popular textual browser (NOTE: text browsers don't show any form of graphics).

To access the Web you must either use one of the above mentioned browsers on a machine such as a Sun, PC or Mactintosh, or if you want to access it via your Atari you will need a copy of the Lynx browser as unfortunately there aren't any graphical browsers YET for the Atari.

Next month I will give full details on how to access the Web using the Atari.

==========

Where do I find the Atari Web page?
~~~~~ ~~ ~ ~~~~ ~~~ ~~~~~ ~~~ ~~~~

From your Web browser choose to open URL and enter the following address:

http://www.dl.ac.uk/MISC/ATARI/atari.html

If you can store a hotlist of addresses or something similar on your browser then it may be worth including this address for quick access in the future.

Once you've done that you should see my main page so I hope you enjoy it, and don't forget to write with your thoughts.
~~~~~

==========

What you will find in the Web pages every month.
~~~~ ~~~ ~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~ ~~~~~ ~~~~~

From the main menu you have several links available to you, some under miscellaneous and others specific to a particular machine, or collection of machines. First I will look at what will be in the Miscellaneous section.

****

Atari Related links, Documents, FAQ's and Newsletters
~~~~~ ~~~~~~~ ~~~~~ ~~~~~~~~~ ~~~~~ ~~~ ~~~~~~~~~~

First in the list are "Atari Related Links", these links are to other sources of Atari information or data (such as files, etc.).

There is a link to many of the major Atari holding FTP sites on the Internet. Links to several Web pages by different people on the Atari. This will grow as worthwhile sites come up. At the moment you can visit:

- HENSA to download Atari files (Moderated by Denesh Bhabuta)
- ZFC's Atari Pages by Annius V. Groenink. This has links to various Atari related places, along with talk of his own work on Edith and his new Drive U Project. Annius is also working on a version of the Mosaic browser for the Atari and the best of luck goes to him on that.
- Christer Gustavsson's Atari Gem Programmers Page. Very useful information for programmers grapling with Gem and the operating system. Also offers help via his questions answers page. Some links can be found to Atari related places.
- CAIN Atari Pages. CAIN is the Central Atari Information Network and they create a newsletter which is updately monthly on all things new to do with the Atari. There are also links available here.
- Martin Maisey's Atari Pages. Contains information (downloadable) on programs written by himself for the Atari. Again there are links to other Atari places.

This section has one or two more candidates for the near future when more work has been done on the owners pages.

Documents
~~~~~~~~~

Useful documents will appear in here. At the moment there is:

- Atari FTP List by Hallvard Tangeraas (essential for the latest news on who provides Atari FTP sites). This is updated in theses pages almost as soon as Hallvard changes it.
- Atari TOS Desktop Survival Kit by Thomas J Hopper. An essential guide to getting the most out of your DESKTOP.INF and NEWSDESK.INF files.
- Recommended list of software for the Atari by Denesh Bhabuta. List compiled by Denesh for me of his best software for the Atari (updates coming soon). Mostly PD and Shareware, this list contains links to download most of the software mentioned.
- Information on picture formats by Dave Bagget. Lots of information on the format of different picture files for the Atari.
~~~~~~~~~

FAQ's (Frequently Asked Questions)
~~~~~ ~~~~~~~~~~ ~~~~~ ~~~~~~~~~

Useful FAQ's will appear here. At the moment there is:

- Atari ST SLIP FAQ. This is a guide to connecting your Atari to a network. All you want to know about networks and the Atari.
- Atari CD FAQ. Information on getting and using CD's on the Atari. Regular updates to this can be found in my pages.
- GDOS FAQ by Gerd Castan. Got a question on GDOS then this is the place to look.

Newsletters
~~~~~~~~~~~

Although there may be more to come the following newsletters are updated promptly as I receive them:

- CAIN Newsletter containing the latest Atari news.
- HENSA Newsletter containing the latest updates to the HENSA Atari archive.

****

Questions and Answers
~~~~~~~~~ ~~~ ~~~~~~~

Submit your questions to here and get them included in this page. Answers are open to anyone who has something valid to say, and help is provided to me on Programming and Music questions by several knowledgeable sources. Please support this section, only by your interaction and questions will it survive. All answers are included in this page for anyone else with the same question and answers are also sent back to the person who submitted the question for those without Web access.

If you feel you have an expertise in a particular area concerning the Atari and would be willing to answer questions on that area when and if I submitted them to you, then please let me know and you can join the team. Programming and Music are fairly well covered and I can cover Graphics programs, help with Technical questions would be appreciated.

****

Reviews
~~~~~~~

Here I hope to include reviews of Atari products both new an old. So far I have the following reviews:

- Kobold review by Andy Curtis (ST Format)
- Flash 2 review by Frank Charlton (ST Format)

There are several reviews on the way by the above mentioned people aswell as some by myself (waiting to get hold of Apex Media for the Falcon). This section should hopefully include around ten or more reviews by Christmas.

Again if you feel you would like to submit reviews for inclusion then please write to me. Please note these pages don't include Lynx and Jaguar Reviews, as they are contained within their own pages.

****

Updates and Information on these Web Pages
~~~~~~~ ~~~ ~~~~~~~~~~ ~~ ~~~~~ ~~~ ~~~~~

All updates and news on the Atari Web pages goes in here. Previews of whats to come soon are included and new items or updates to the pages are listed according to date with the most recent being first. Most updates contain links to the new material for instant access.

Other things to be found in here are the number of accesses to the Atari pages. At the moment this is out of date, but I hope soon to have this updated on either a monthly or even weekly basis.

****

This now concludes the Miscellaneous section. Now onto the Other Pages. These pages are specific to a particular machine, or collection of machines. These are going to go through some major changes and you can expect a fair number of changes to be made to these in the next month or so.

****

Falcon Page
~~~~~~ ~~~~

This will contain information and files relevant to the Atari Falcon, currently this page is divided into the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

In here expect to see any news or previews that come my way, whether they be small descriptions or full features with pictures. At the moment there is:

- Apex News. This contains some information I got on Apex Media for the Falcon when I spoke to Douglas Little on the phone a few weeks back. Not very detailed unfortunately, but I'm waiting on my copy of Apex to give a full review so expect that to be rectified soon.
- Dextrous News. Small description of some of the features of Dextrous with a picture. Only at an early stage of development, if I hear more it will go in here.
- Towers II : Plight of the Stargazer. Pictures and description of this great looking Falcon only sequel to Towers. Expect the demo soon.
- Newsletters from HENSA on Falcon section of archive.

Misc
~~~~

Miscellaneous information on the Falcon, including:

- Falcon Demo FAQ. List of Demos for the Falcon, including some form of information on each.
- Compatibility list of games with Falcon.
- Compatibility list of applications with Falcon.

New Software
~~~ ~~~~~~~~

The latest Falcon/enhanced software available for download. Major revisions to be done with updates here. At the moment the following software is included, with more to come:

- Play MPEG v0.68 by M.D.Griffths (shareware)
- Speed of Light v3.5 (shareware picture viewer)
- FOG issue 6 diskmagazine for Falcon
- Scape a planetary landsacpe generator.
- Digital Tracker demo of commercial version.
- Obsession 1 level demo.

Other software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth using on the Falcon.

- Backward v2.52. For compatibility with the ST. Please send any versions which are newer than this.
- MultiBlow. Configurable overscan utility.
- Starball. Excellent pinball game (Falcon enhanced).
- Berzerk. Excellent version of Berzerk (Faster on Falcon).

****

Atari ST/STE/TT/Mega STE Page
~~~~~ ~~~~~~~~~~~~~~~~~ ~~~~

This will contain information and files relevant to all the above mentioned Atari formats, currently this page is divided into the following areas:

News
~~~~

In here expect to see any news or previews that come my way, whether they are small descriptions or full features with pictures. At the moment there is:

- Newsletters from HENSA on TOS section of archive.

New Software
~~~ ~~~~~~~~

The latest (most recent versions) software available for download. Major revisions to be done with updates. At the moment the following software is included, with lots more to come:

- Speed of Light v3.5 (shareware picture viewer).
- ST Zip v2.6. Latest version of ST Zip.
- Obsession demo. 1 level of this great pinball game.
~~~

Other Software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth having on the Atari.

- Ozone. Good platform/puzzler.
- Starball. Excellent pinball game.
- Berzerk. Excellent version of Berzerk.

****

Lynx Page
~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News
~~~~

News on the Lynx and related material. At the moment there is:

- Lynx Summer Steal Deal Extended to the Fall. News of price reductions for a limited period.

Reviews
~~~~~~~

Reviews for just about every Lynx game ever released will appear in here. All reviews are by Robert Jung. At the moment the following reviews are included:

APB Awesome Golf Baseball Heroes
Batman Returns Basket Brawl Bill and Ted's
BlockOut BattleWheels Blue Lightning
California Games Checkered Flag Chip's Challenge
Crystal Mines II Dino Olympics Dirty Larry:Renegade Cop
Dracula the Undead Double Dragon Desert Strike
Electro Cop European Soccer Chal. Ultimate Chess Chal.
Gauntlet:3rd Encounter Gordo 106 Hard Driven'
Hockey Hydra Ishido : Way of Stones
Jimmy Conners' Tennis Joust

Other Lynx Stuff
~~~~~ ~~~~ ~~~~~

Other items of interest to Lynx owners. At the moment there is the following:

- Lynx FAQ

New Software Anouncement
~~~ ~~~~~~~~ ~~~~~~~~~~~

Currently holds news of Bouble Trouble and Super Off-Road for the Lynx. Expect reviews soon.

****

Jaguar Page
~~~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

All the latest news and preview information I can find related to the Jaguar. Although empty at the moment expect this to fill up very soon (lots to come).

Reviews
~~~~~~~

A collection of reviews from different sources, hopefully I will be contributing more to this section myself. Reviews so far include:

Aliens versus Predator Raiden Tempest 2000
Cybermorph

There are many more reviews to come.

Other Jaguar Stuff
~~~~~ ~~~~~~ ~~~~~

Miscellaneous information on the Jaguar. Information included presently is:

- Jaguar FAQ
- Raiden Tips
- Jaguar Game Cheats
- Kasumi Ninja FAQ
- Ultra Vortex FAQ

Other Jaguar Pages
~~~~~ ~~~~~~ ~~~~~

Other pages specific to the Jaguar included in here. Currently there is:

- Atari Jaguar Homepage by Nils Jacobsen

There are others that will be included, some containing more recent news, but the one above is the most organised and intuitive one I've came across.

****

8 Bit Atari Page by Ivo van Poorten
~ ~~~ ~~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~~~

Not maintained by me these pages cover the 8 bit formats of Atari machines and are very comprehensive. Nearly everything you could hope to find is contained within these pages.

****

What to expect in the future
~~~~ ~~ ~~~~~~ ~~ ~~~ ~~~~~~

Some structural changes are likely to appear in the next months. I will be introducing an announcements page where you can tell the World of anything you have to announce. Please send news of updates to your programs, Atari stuff for sale, and any other Atari announcements here (NOTE : Commercial companies should send information on products to be included in here and in the news sections).

Also coming soon will be a monthly editorial. In this I will try and sum up the month past and to give my opinions on how I saw things for Atari at that time. Hopefully I will be able to look back over many good developments in my pages and summarise them as they happened.

There is an outside possibility of starting a programmers and MIDI section in these pages but this is as yet undecided. I will judge whether or not to do this based on the kind of response I have. I do not want to repeat any of the good work done in these fields however by other Web page writers such as Christer Gustavsson.

More support is needed for the questions and answers pages, although initially successfull people just stopped posting their questions. Although the odd one is still coming and answers are still forthcoming. Please support this, it is of benefit to anyone who uses it.

The Jaguar section should have a lot more news, pictures and reviews in the future. I now own a Jaguar and will soon be writing a review for Aliens vs Predator. I have tracked down a fair bit of news and am in contact with a few companies now and hope to get news from them on there products.

Extra pictures will appear due to my recent access to a colour scanner, enabling me to scan the latest pictures before the exist elsewhere on the Internet. I also hope to slowly get all the maps for AvP into these pages somehow?

Both the ST and Falcon sections should contain much more news in the future, along with more of the best PD/Shareware, and PD/Shareware reviews. I should have several demos hopefully in the near future for games coming out on these formats.

The Lynx section is to continue to get reviews and I will update the news as and when I get it.

Expect more links to Atari related pages in the future, aswell as links to all the Atari related newsgroups. There will be more newsletters, documents, updates to the FAQ's, I hope to include AEO soon also.

Expect further reviews from Andy and Frank, along with myself (watch out for the Apex Media review). Hopefully I can include more screenshots, and do a few program tutorials.

Last but not least, after Christmas I may set up a feedback page, where you can send your feedback via a Web form. Until then please write with your ideas, critisms, comments, submissions (software, news, reviews, questions, etc), to me and don't forget that I am now the official maintainer of the Atari FTP list originally by Hallvard Tangeraas. All updates to this list should now be sent to me.

Thank you and see you with the updates to these pages next month!

3724. Need Help for STPascal+

Newsgroup: comp.sys.atari.st
Date: 1994-11-23 13:11:51 UTC
From: anker@stud.uni-sb.de
Message-ID: <3avf2n$afn@stud.uni-sb.de>
Source record: 176237

Hi there!

I have problems including libraries into Pascal executables. How can
I link pastrix to my source codes???
Can anybody send me a source code?
(I work with ST Pascal Plus ver2, quite old, I know, but where is something
new???)
Besides, I'd Like to know if there is a Borland-compatible Compiler for the
ST.

My eMail-address is anker@stud.uni-sb.de

Andreas.

Well, I don't know about version 1.11, but something called MiNT 1.12
(yes, one-twelve) has appeared on several of the major ftp servers.
The three archives contain source, docs and BINARIES.

I tried it, and somehow it _seems_ considerably faster than the old MiNTs,
but that could be because I haven't run it for so long.

What is your little comp person called? Mine was Franklin, he was dead cute and a piano master! :)

I think you have to ask him to do things, ie PLEASE WATCH TV etc...
You can get him to write you letters, just ask him, but remember to put the PLEASE on there. Also press the CONTROL and various keys and you can deliver stuff to him, food, records, post etc... and make his phone ring, when he sits down to answer it you can tickle him - no, really you can!!

:-)

Aaaah nostalgia

Obsession may be the better game as long as it wants - it doesn't run at all on
my TT, whereas Starball does.

(Not that I usually use my TT as a games machine; I have a 486 for that task -
but it's nice to have sort of a distraction without having to plug the monitor
to another machine.)

> works to perfection!

It is likely that if you set your TERM environment variable to ansi (as opposed to vt100), this problem will go away. On a UNIX system, this is often done in .login or .profile in your home directory (setenv TERM ansi). After doing this, FZT should work with no bobbles, but you won't get some of the nifty text attributes that vt100 has (underlining, etc.). This is a relatively small loss.

The "B" that you are seeing is probably part of a vt100 control sequence that is not supported or different in ansi. Thus, if you tell the other end to speak only in "ansi" language (via the terminal variable), you should not have this problem.

While it is quite true that vt100 is the vastly prefered terminal type to emulate for UNIX modeming, just about any UNIX system will support many other types of terminal emulations. Take a look at /etc/termcap (or the equivalent on your system), there should be hundreds of entries for various types of terminals. Some terminals have more capabilities than others (various text attributes, for example). In many cases, vt100 is the "default" terminal type, because it is so popular (for example, many login scripts will try to figure out what kind of terminal you are really on, and default to vt100 if they cannot). Telling a UNIX system that you have something other than vt100 is relatively easy, and can be automated as described above.

So, basically, if FZT or other non-vt100 program is your favorite, you can set things up so that it works just as intended on virtually all UNIX systems, with the only loss being some fancy text attributes (man pages don't look as nice, for example, due to lack of underlining). Most important, you can eliminate any weird garbage that incorrect terminal types will produce.

Hope that helps.

This week the first issue from a new german Atari-Mag came out, and
there were some interesting news.
1) The Eagle is available soon.
Specs: 68040 with 32/64 Mhz, ACSI,SCSI,parallel,LAN,VME,Midi-Ports;
up to 14 MB ST-RAM, and 256 MB Fast-RAM; price 3498 DM.
Later a 68060-version will come out.
2) 4 new Atari-CD's will come out soon.
3) It is quite possible that Atari will be at CEBIT-95;
4) they had some kind of "rumour-page" in the magazine, and there
they were talking about a new Atari-computer called "Milan"

> 32MB partitions.

IMHO, the best package for this kind of thing is Diamond Edge. It can do two kinds of undeletes (either of which meet your requirements above, except perhaps "fast", as that is a relative term). The first is a standard FAT table undelete, where some clusters may have to be reconstructed. The second (mirror undelete) is essentially the same, but has a bit of help. Edge comes with a program called Diamond Mirror, which is very similar to Norton Image. It is an auto folder program that will save your current FAT table and directory sector entries for your partitions into small files (this is quite fast, about 3 seconds for my 5 partitions). You can tell it to do so on every boot, once a day, or once a week, for whatever partitions you desire. Anyway, if you delete a file, and it happened since the last "mirror" of that partition, you are guaranteed to be able to find all clusters that had to do with that file, due to the information the mirror program saved (of course, if you have used any of those clusters since the delete, you still have a problem, but that is true in all cases). So, it is a standard undelete with a bit of help :-). The idea is that Mirror undeletes have a higher chance of success than regular deletes.

Diamond Edge is a great package, I recommend it highly. In addition to undeletes, it has extensive ability to fix damaged disks, guard against disaster (saving critical info into small files on a floppy, which can be used to quickly recover from a partition or bootsector corruption), optimized (defraggment) your partitions, make incredibly fast partition-to-partition copies, partition and surface scan disks, etc. etc. It is about as close to the Norton style PC/Mac utilities as does exist on the ST/TT/Falcon, and appears to be rock-solid. Anyone who has valuble info on their hard drive should own this package, IMHO.

I am in no way connected with Diamond Edge (Oregon Research), other than as a satisfied customer.

: I copied out the printer configurations available in my Wordwriter Program,
: but am nervous about picking up a printer that doesn't match these
: configurations exactly. (company and item #)

The printer configs in Wordwriter are easy to edit for most printers but too limited for most modern printers. Still one can embed printer codes in documents but WordWriter doesn't support templates so that could be a problem to do over and over. Personally, I upgraded to That's Write 2 (then 3) and haven't regretted the expenditure ($179 US) [Plug: You can use Speedo Fonts without buying Speedo 'cause its built-in to That's Write!].

: What's the important thing to remember to make sure the printer will be
: atari compatible? I don't expect the sales people in some of the Toronto
: computer stores to know the difference.

To my knowledge, any printer capable of Epson or IBM emulations will work fine on an Atari. Of course others will as well if you have an appropriate driver. I've got a Citizen GSX-130 (24 pin) (<$200 US)

Walter Hellman (hellman@teleport.com) wrote:
> What simms are needed to take a 1 meg STE to 4 meg?

30 pin, 8 or 9 bit 1mb SIMMs, at least 150ns or less (you would find it hard to find any SIMMs that are slower than 120ns or so, so that last part is easy).

> Is there anything
> special about the installation?

Absolutely easy. See below.

> Is there any software follow-up needed?

If you want to use a 2.5mb configuration (two 1mb SIMMs, two 256k SIMMs), then there is a special order the SIMMs must be plugged in, plus you need a small auto folder program to fix an MMU bug. The program is called SIMM FIX, and is available on atari.archive.umich.edu in /Utilities/Tosfixes, or perhaps /Ste. The text file that comes with it should describe the ordering.

My suggestion would be to just jump right to 4mb. You just fill all available slots with 1mb SIMMs and you are done, no hassle.

> Does anyone know of on-line instructions for the upgrade posted
> anywhere?

1. Unscrew the screws on the outer edge of your case, except for the three that hold the floppy drive on. As you do each screw, note if it is a long one or a short one (I wrote a little "L" or "S" next to each screw hole as I did it). I think all the external ones are long, but this is a good idea in any case. The ones that hold the floppy in are really long (about 1" or so), so you'll know if you hit one of them by mistake. Use tweezers to remove the screws one at a time, don't flip the machine over and shake (you will be cured of this urge after loosing your 100'th screw or so :-).

2. Flip machine over (it was upside down for the above step, of course). Remove top of case (rotate it off the floppy drive front face. Locate keyboard connector plug, unplug it, and lay keyboard to side (you can also just rotate it out of the way, though if you knock it off the table it has a greater potential for damage). You cannot plug the keyboard in the wrong way, so no worries.

3. From the front, centered and slightly to the left on the big metal heat shield inside the computer, you will see a small metal plate held on with short screws (remember to note the length of them and put them back in the same holes latere). Remove this plate, and you will see your existing SIMMs. I think it is right in front of the power supply. There is only one such plate, so you cannot miss it. You will see your existing

SIMMs.

4. SIMMs have a hole on each side of them, and the SIMM sockets have small plastic fingers that slip into these hole to secure the SIMMs. Using a small pointed tool, carefully push the fingers out of the holes and tip the SIMMS back for removal. You must start with the rearmost SIMM, because they only top one way. The side with the chips on it is "front", for SIMM orientation. After they have been tipped back enough, they just pull straight out at the same angle to which they are tipped. Before you pull one out, note how deep it is in the socket. This will help you judge your insertion depth (no jokes, please) in step 5.

5. Insert your new SIMMs, in the tipped-back position. Here is where a lot of folks have problems: Make sure you push them down fully into the socket while in the tipped-back position. You should hear them "crunch" a bit as the 30 pads on the SIMM make contact with the little feelers in the bottom of the socket. Note that you must insert the SIMMs in the reverse order you took them out.

6. Rotate the SIMM into the upright position, until the little fingers click into the holes.

That's it! Don't be a goober and put the rearmost SIMM in first (which prevents you from inserting the other ones, I always seem to do this :-).

Also, the only time I use a static wrist cable is with memory installations. With SIMMs, you can just be careful and avoid touching any of the pads on the bottom. Memory is quite static sensitive, so handle them carefully (SIMMs are much easier to deal with than chips, hence their popularity).

From: deepthought MMDF Mail System <mmdf@armory.com>
Date: Sun, 20 Nov 94 7:05:17 PST
To: Kim@dksoft.ping.dk
Subject: Re: FOG
Message-Id: <9411200705.aa16399@deepthought.armory.com>
X-Charset: ISO_8859-1
X-Char-Esc: 29

Your message (id <EKUPECUQUp@dksoft.ping.dk>)
was received on deepthought.armory.com by the following
users, or their agents:

requiem

As you can see, i tried e-mail you (I've tried many times now). And the
system you connect to do receive the messages.

Your move!

Kim

From: h9250467@idefix.wu-wien.ac.at
Message-ID: <3b03dl$f8c@osiris.wu-wien.ac.at>
Source record: 176281

John Townsend (John_Townsend@taligent.com) wrote:
: In article <3a2d96$ar5@osiris.wu-wien.ac.at>,
: h9250467@idefix.wu-wien.ac.at (Alfred Radauer) wrote:

: |Hi John!
: |
: |Ihave been reading with interest your comments on Atari computers,
: |especially the one where you critisised that TOS would not stand up to its
: |competitors, in terms of features, networking etc.... I got an old German
: |Atari newspaper here that states that a certain, high rankingAtari person,
: |a system programmer for Atari, namely John Townsend, has quitted Atari for
: |Taligent software. If you are not that person and anything inthat last
: |sentence is wrong, I will by all means excuse myself and ask for apologies.
: |But if you are that person (which I think is highly probable), then I am
: |little bit puzzled.

: Yes, that is me. I left Atari to join Taligent in March of 1993. I was at
: Atari from September 1987 to March of 1993. I did everything from
: Technical Support for Atari products to COMDEX shows to system
: builds to development on pieces of TOS.

: |
: |I mean, if someone is haveing a job at a company, he has to stand up
: |usually in the morning, get to work at around 8,9,10 am and stay till in
: |the afternoon. I assume you also did this, I also assume that you got paid
: |for doing work for quite a period of time at Atari. Now, on the other
: |hand, I am looking at TOS/GEM, which is a work mainly done by DR and the
: |things Atari did with it. Now, during the period you worked at Atari, the
: |things the system programmers did, were:
: |some bugfixes and adaptations to STE and TT
: |TOS2.06 desktop
: |modular control panel

: I worked on lots of things. The Atari eXtensible Control Panel, a number of
: control panel modules, the SetMode() video driver stuff for the Falcon030,
: more testing code that you can possibly imagine, and lots of other things
: that I cannot and will not discuss with you.

: |Considering what other programmers did during the same time, I kindly ask:
: |WHAT DID YOU DO AT ATARI ALL THE TIME?
: I certainly didn't flame people on the net about their work, thats for sure.
Well, you did not flame them directly (see below)
: |drinking coffee? playing games? I think the amount of work you did at
: |Atari gets you a pure "F" , a 5% score at most. If you critizise Atari TOS
: |(which, BTW and to your knowledge of Atari computers has nothing to do
: |with "Magic or so") , then you are ciritizising your own work.

: No, I am saying that TOS hasn't managed to live up with the rest of the
: world when it comes to features in the operating system. And I challenge
: you to prove that it has. It doesn't have networking software built-in,
: it doesn't have online help, it has a very basic graphics system, it doesn't
: have email support available. There are so many things that the Mac and
: PC can do that TOS can't that it makes it really hard for TOS to compete
: with these operating systems.
Agreed, but to a 100% only when it comes to TOS. There exist programmers,
however, that have managed to build at TOS compatible operating system
called "magic" that is very powerful. It has most of the features
available that you have (in your original posting) crititizsed as lacking,
i.e. in v3 loadable file systems (a mac filesystem is already there).
preemptive multitasking (which neither Windows nor MacOS do offer); the
"basic" graphic system NVDI 3.01 is, IMHO, one of the best graphic systems
available, certainly a lot better than Windows GDI. All the tools that
would provide for Online help are readily available as Public domain or
sharemware (1st Guide, ST Guide) and are of very good quality. I also
doubt there are shells on the PC that can compare to Gemini, Ease or
Neodesk4. It is true, howver, that
a) you do not get all of the tools in one box and have to "flick" the
system together
b) that there are currently no decent networking facilities available.
However, Kay Roemer has said that he will port his MintNET to Magic3, when it
comes and the docus will be made available to him (and I do not doubt that
they won't)
Magic will also be available for the Macintosh, so there is no reason to
depend on Atari at all.
When it comes to development, I think Magic will take a way somewhere
between a commercially produced OS and an OS with many shareware
programmers working on it, just like Linux (which, IMHO, outperforms all
commercial OS Apple, IBM and MS are currently offerning).
OK, maybe not that much programmers- but still.
To say to you: TOS is not Magic; and I think any statements referring to
magic whilst speaking about TOS is a hidden "flame" against the Magic
programmers or at least showsa lack of knowledge.

: In a way, yes.. I guess I am critical of my own work. The way I look at it
: is that I am critical of the history of TOS. Yes, I was a part of that history.
: No, I didn't have any decision making abilities during that history. I had
: little or no input into what direction TOS went. It was decided at higher
: levels than the system programmers group.

: |One of
: |Ataris biggest mistake was not to fire people like you (there are still
: |some left.....) earlier, people , who do nothing, consume money, much
: |erlier.

: Oh that's rich. You don't even know my (except that you read my name
: in STReport) and you are saying that Atari should have fired me? I bet
: I can find people right here on this newsgroup that will disagree with
: you. You are entitled to your opinion, even if its wrong. I worked very
: hard for Atari and I did what I was told to do. If you don't like that, then

: that's your problem.
I do not know about STReport. I read your name once in a German mag.

: |It is a shame, that a company as Atari has to, because you were
: |incapable, buy tghe kernel for the operating system from someone else, who
: |programmed in his freetime. What was your commitment to the Atari system
: |software? Now let us assume, youare far from being a decent programmer:
: |Why did you not at least document existing OS functions? Why no support?

: I was no responsible for documenting Atari's OS functions. Atari told the
: system programmers group that there were people taking care of this. In
: addition, Atari had a full-time member of the team that was responsible for
: documenting our work. I cannot and will not be blamed for something I
: didn't have control over. And I did support people. I supported them more
: than you can possibly comprehend. I did support on GEnie, CIS, Delphi,
: BIX, email, Mail, the net.. you name it.. I was there. In fact, for a great
: part of my time at Atari.. I was the ONLY one who was there. So, don't talk
: to me about support. I have done more for Atari users in that area that you
: could ever even think of doing.
Well, if your follow up to the discussion would not have been that
emotional against Atari users ("remain in the past" and the likes) and
your comments about Magic being that utterly wrong, my follow-up wouldn't
have been as emotional either.

: |Now, after you quit Atari, you appear in discussion groups, now, when
: |nobody actually needs you and your comments.

: I have just as much right as you do to post my opinions and comments
: in this forum.

: |It also puts a bad light on Taligent, if they hire you. It is quite a
: |time, when i had a discussion with a person, who dows not like Atari (and
: |his arguments are objective) about futuere operating systems and he was
: |shocked to hear, that programmers from Atari were working on Taligent. I
: |suppose you atari newsgrouop activities take place during your freetime
: |and not during working hours at Taligent, don't they?

: I work long hard hours at Taligent (I just finished a major untaking that
: rquired me to work for 2 months straight without a day off.. that's not my
: record.. the record was the Falcon030.. I spent an entire summer working
: 12, 14, round the clock days to get the Falcon030 out the door.)

: Not to mention that my posts clear say that I do not speak for Taligent. If
: you are foolish to base your opinion of Taligent on my comments about
: TOS and Atari's computer products, then I feel sorry for you.

: Using your logic, Atari didn't have good people. Atari had really good
: engineers. They didn't have enough of them though. Take a look at Apple.
: They have hundreds of engineers working on System 7 and System 8.
: Microsoft has hundreds working on Chicago. Atari can't compete with that.
: They only have a hand full of people and no matter how good they are,
: they can't compete with work that Apple and Microsoft can produce. There
: just aren't enough hours in the day.

I do not doubt they had good engineers, however, their performance in
mainating an OS was of much pooroer quality than the development on the
hardware side.

: |Now, as Taligent is
: |far from being finished and far beyond schedule, and I even can guess the
: |reason (Townsend and Co.) I will glady buy Microsoft shares, because
: |whatever you are doing there at Taligent, if you are working the same way
: |as with Atari, it cannot be of acceptable quality.

: This comment doesn't even deserve a reply. You are nothing more than
: a person looking to bait me into an argument about something you know
: nothing about.
I never intended to bait you into an argument involving Taligent, I wanted
to know about your work at Atari. This comment was just an emotional
sideline, again, because you seemed to tell the people, who still use
Ataris or better Atari compatible operating systems that they are
"dreaming", or just merely "stupid" to do so and "not to see reality". If you
didn't mean that and you are not that careful with the tone and the
vocabulary you use, then why should the others?

: |Sincerely yours,
: yeah, right.

: --
: -- John Townsend "I want something, I just don't
: Taligent, Inc. know what it is!"

: Disclaimer: I don't speak for Taligent, I speak for myself.

3750. Re: Rumor - Falcon w/PowerPC

>
>I still like Atari. I like the company. I think Jaguar is a great product.
>I just hate to see people get their hopes up for the "Falcon060" or
>something like that. I don't think it will happen.
>

And it doesn't have to happen, at least not coming from Atari. With the
falcon we have now, Atari has done their part of the deal. What we really
need a cheap, (well, i had to say cheap) choices to bring our Falcon's up
to a standard where we can be proud of mention the name Atari again. This
upgrade can come from another company or from Atari, i really don't care
who does the upgrade. What i care about is, how easy is it to upgrade,
(do you have to travel around the world by phone to get an upgrade), and
whats the price. As far as i have heard untill now, those 68040 cards which
are available now is far to expencive for us. We pay almost doubbel the
price it would take to buy a new 'standard' Falcon, and thats way out of
line. The producers excuse them selves with low maket statements and high
prices on the komponents, but thats just a lie. A 68040 card isn't really
that expencive to build when you look at the komponents used. And if they
feel they got a low market, a high price on a upgrade is not gona do any
good to their market at all. It will do much worse.

So whats really the deal here ? In my opinion it's cold buisness and profit.
Something Atari can't compete with in a lowend price of personal computers.

Just saw an offer on a PC. Read and dream:

486DX2 66Mhz
4Mb ram
420Mb harddrive
14" SVGA monitor
DUAL SPIN CD-ROM drive

16Bit sound card included 2 small speaker.
DOS 6.20 and Windows (latest version), installed and ready to go.
And a few Cd's to play around with.

Price.... 9.995 Kr. (Danish crowns)

Recalculated to other countries.
Price.... about 995ï¿½ (UK pounds)
Price.... about 1700$ (US Dollars)

I wonder what a 'standard' Falcon will cost if all the included devices
such as CD-ROM drive, monitor and 420Mb harddrive, speakers was suppose to
be included. And just to make things even worse, you can find a PC dealer
at almost every corner here in Denmark, and we only got 1 (maybe 2) atari
dealers left in the hole country.
So the last thing I (we) need is expencive upgrades. It'll do more damage
to our market to produce expencive upgrade, than not to produce them at
all, if you know what i mean ?

Greets
Kim

I had an offer to update to OS2 Warp today, actually :-). This because IBM in
Sweden offered a free copy of OS2 3.1 to every university student and I wasn't
late to get my copy. I haven't got a PC but my father is going to get one when
he starts his new job. Well, well, enough talk... The friends I have that have
PC's seem to think OS2 3.11 is quite nice, and OS2 Warp can't be less nice. It
needs less memory and is faster. I guess it is a good alternative.

: |Is this supposed to say anything? John Townsend worked as a systems
: |programmer for Atari and I am wondering how a person can work for such a
: |long time and produce so little.

: You don't know anything about what I did at Atari. How dare you attempt
: to accuse me of "sitting on my hands" during my time at Atari. Atari had a
: small staff of systems programmers (their choice, not ours) and we did
: pretty good considering the constaints we worked with.

: |Is it clear to you, that those people
: |never went beyond a control panel and a simple graohics shell while they
: |were being paid by Atari? They even had to buy the kernel of the
: |multitasking system from a person programming in his freetime, they never
: |were able to hold deadlines and they even were not able to produce some
: |kind of documentation.

: I was responsible for a number of things including pieces of the new Control
: Panel. But, you consider that small potatoes eh? Well, I think if you ask around
: on the net and in the Atari community, I think you will find that many people
: like it.

: As for the multitasking system, when Atari started to investigate adding
: multitasking
: support to TOS, they looked at what it would take and also looked at what
: solutions already existed. MiNT looked to be a pretty good solution and so
: we made a deal to get it. Why should Atari recreate what has already been done?
: As for deadlines and documentation, we did produce documentation. And you
: show me you announced deadline that Atari's systems software group didn't
: meet and I will call you a liar to your face.

: |If you say, they played with more computers than we
: |had dinners, I am taking it word by word. I even can imagine John playing
: |Doom on his PC during working hours at Taligent.

: Oh, this is good. You don't even know me and you are questioning my work
: ethic? How dare you! Who the hell do you think you are? I work very hard
: at Taligent and Taligent has nothing to do with this discussion. I appreciate
: your effort to sidetrack my comments into a personal issue, but you can just
: forget it. I am not going to fall for it.

: |BTW, did you also notice
: |that Taligent are far from being on schedule with their operating system?
: |That people evem did not see anything from Taligent except announcements

: |on low level routines?

: Taligent is far from being on schedule? That's funny.. the dates that I have
: seen in press releases can that Taligent plans to ship something during
: (and I quote) "the mid 90s." How can we be behind schedule? Anyway, I
: do not plan to comment on Taligent release plans or products, so you can
: continue to bait me, but I will ignore anything on this subject from this
: point on.

: |To consider him an expert or a professional and
: |thus giving more weight to his statements is only possible if he can show
: |references. And a control panel anda TOS 2.06 desktop hardly qualifies
: |John as such an expert, consiedering the time it took to develop those
: |"powerful" tools, and his work at Taligent is far frombeing visible to the
: |public. I stated all the above critics into an open letter to John, let us
: |see if he hast guts enough to answer it and give an account on what he did
: |at Atari.

: And what have you done for the Atari community? What gives you the right
: to question my "professionalism?" Let's just put it this way.. I did enough
: interesting work at Atari that I was able to get myself a position at Taligent.
: And I don't have to answer to you or anyone else. So, if you don't like me
: or what I have done, that's too bad for you. Frankly, I don't give a damn.

: --
: -- John Townsend "I want something, I just don't
: Taligent, Inc. know what it is!"

: Disclaimer: I don't speak for Taligent, I speak for myself.
Frankly speaking, if you would have made your comments (in your original
posting) by using a more "dry" vocabulary (this is also what I refer to as
"professionalism), I would not have written in that style to you and many
others would not have flamed at you, either. Fact is, however, that the
all-knowing tone you used in your posting could VERY WELL be interpreted
as an insult towards those people working with Atari computers and those
who are programming for it. I truly and wholeheartedly apologize for my
comments,
but I also suppose you to use your vocabulary more cautiously, when you
explicitly write YOUR opinions.

Alfred

P.S: this is is also for all the other follow ups from John

] Has anyone used Kobold yet? Will it significantly improve file operations
] even if you are not using MagiC? Can it run in conjunction with Neodesk,
] Geneva, regular TOS 2.05 or Multitos? Is it worth buying? Thanks!

It won't work with any of the above, other than Magic+Ease. It improves file copying speed by roughly 4 times. It has to be seen to be believed. It writes the files using a semi-illegal method, (writes the data straight to the disk, and then enters the appropriate FAT and directory information). But it's very reliable, and fast.

It doesn't appear to work with Geneva at all, even disabling as much of Geneva as the user can still prevents it from working correctly. I've told Dan Wilga (Gribnif) about this, and presumably he's looking into it.

By "won't work with" I mean it isn't supported by Neodesk or AFAIK
TOS. Gemini and Ease are both apparently configurable to use
Kobold as a replacement to normal file operations. It will however run
as a normal application under all of the above (except Geneva).

hmmm. Look - Just because Atari hasn`t released a new computer since 1992, it doesn`t mean that the Atari-computers are dead.

Have you ever heard the word `clone` ???

In fact two Atari-clones are out now. And Atari have licensed (not sold!) thier TOS to third partys.

" Atari R.I.P. " HA! thats far out..... It`s more like "Commodore R.I.P.".

By the way, that ACORN is a fine machine indeed (I tried one on the Elsmhorn ATARI-Happening in Germany), there is just nobody in Skandinavia, who has ever heard of it. It seems that the only two countries who knows of its existence is England and some places in Germany. At least here in Europe.

Does anyone have confirmation of the rumour that Atari have over 2000 *Atari* CD-Rom drives sitting in a warehouse in the UK ? Remember the drives they were going to release, but never did ? Does anyone *know* for sure ? ...and more to the point...if it *is* true, what are Atari intending to do with them ? Surely they can't scrap them ?!?!

....maybe they'll sell them off R-E-A-L-L-Y cheap. ...and maybe they'll produce a 68060 ST :-).

Anyone know if Atari have an e-mail address ?, I want to make them an offer !

>
>
> * Tom Trauth

"For good" is something only the future can answer. Personally I think Atari is going to let a lot of third party`s take over the development of thier computer-line.
In fact it`s already happening.
BUT a wierd thing is still, why won`t Atari license all thier parts of the Falcon-line ??
It could mean that they haven`t given up a 100 % on the computers yet.
Some rumors also talk about a new Atari-computer named the "Milan", but how much there is to it, nobody knows.

A good advise to you, don`t believe what other people `advocate` about - make your own experiences and decisions - it works much better.

Don't sweat it, John. Anyone who tries to honestly speak their mind in this forum is bound to be trounced upon by the mindless-throng. If those thoughts include anything other than roses and champagne for Atari, then you will be regarded an outcast, a blasphemer and a PC-loving Atari-traitor. Such is life in the big city. :)

> Anyway, I guess I am sorry I ever spoke up.
[...]

Personally, I'm _glad_ you spoke up. Your comments were realistic and logical, and guided by knowledge of the real 'inside situation' at Atari. Like you, I think it matters very little, in the long run, what Atari does or does not do in the future. We have enjoyed their systems in the past and can continue to do so for a long time to come. If some decide to move on to other, more solidly supported platforms, that's fine too. Being honest with each other is far more important, IMHO, than casting false rumors of hope for a 'brave new Atari world.' And that's a LOT different than bemeaning Atari or Atari users, which you -never- did.

> I like Atari, I have friends there and I wish them all the success in
> the world.

Take heart in the fact that you still have friends outside of Atari, too. Many of us will long remember you as the 'TOS-God' and for your other significant contributions which served to help us, the users, get even greater enjoyment out of these fantastic fuji-adorned electronic boxes.

Thank YOU, John, and good luck in your future endeavors at Taligent.

> Does anyone know what is a MAC SIMM? Is it the 72 pins ram, the one also use
> for PC? Or is it the outdated 30pins simm?

Depends on which Mac you are talking about. All the newer Centris, Quadra
and PowerMacs utilize 72-pin SIMM RAM. Factory Macintosh SIMMs do -not-
include the extra parity chip, however, and thus cannot be used with PC's
(at least all PC's I know of require a parity chip). On the other hand,
these Mac's can use PC-type parity SIMMs as they will just ignore the parity
chip if one exists.

I assume Falcons require parity SIMMs but I'm not sure as I've never torn
into my Falcon to see. Others here can advise to that issue, I'm sure.

> Stay away from MAC modems and get the fastest you can afford.

Er, not that I really care but what's wrong with Mac modems? For that matter, what IS a Mac modem? Mac's can use the same external modems that PC's and Atari's use. The only difference is the connecting cable and telecommunications software. I personally use the same Supra 14.4 FaxModem on both my Atari -and- Mac via a simple cable switch.

I was under the (perhaps mistaken) impression that one could install Kobold as a replacement file copy utility under Multitos. I know the demo version runs very well under MTOS and TOS on my Falcon as a stand alone application but I was hoping I could install the commercial version such that it would COMPLETELY replace the regular MTOS copying functions.

Is this possible?

3771. GIF viewer for Atari STF

Newsgroup: comp.sys.atari.st
Date: 1994-11-23 23:50:04 UTC
From: npetrlik@public.srce.hr
Message-ID: <3b0kfc$7na@nippur.irb.hr>
Source record: 176282

Hi !

I'm looking for GIF viewer for Atari STF (1M).
I'm not content with software that i have for that:
i've tried Photo Chrome 4 and Speed Of Light 3.0.
Photo Chrome 4 gives a good picture quality, but he's
slow (while processing) and not real time scrolling.
(if the picture is bigger than 320x200 for full
size (for example 720x480) i must pick a part
of picture for processing .. slow ..
Speed Of Light is a fast viewer, but has a bad
scroller (real time) and lower quality ...
but it's fast.

So, i'm asking You if somewherexists GIF viewer
with good quality picture and good scroller ?..

Thanx for any information,
Neven

Correction: some Macs will actually use parity checking if all the memory installed has parity. (Some models have non-parity RAM soldered to the motherboard as well as SIMM sockets for expansion, which prevents them from ever using parity checking.)

Also, a lot of PC motherboards being made in recent times allow you to use non-parity RAM. I built a 486 system for my friend; we installed 8-bit 30-pin SIMMs in it, and it worked just fine. As I recall, that particular motherboard didn't require you to do anything special - it autodetected parity RAM. Obviously, YMMV - every PC motherboard has its own way of doing things..

There is a setup for the Atari for accessing Demon and it is available at

ftp.demon.co.uk:/pub/atari/startup/stnet110.zip IIRC.

Dunno if your manual modem will work with it, probably not.

> Is it true that Demon access requires a 1 (or greater) meg machine?

I'm not sure, possibly, you'll definately need a hard drive though.

>cheaper than the normal price!

Sorry Ofir but I think you will find that is not correct, the Basic
version is Cheap but with the add ons to make it up to a Gold version,
the price ended up dearer than thier last advertised price...

The Add ons and the Fonts packs were far to dear..

You can get the Gold version with Extra Found and UK/USA Dicts for $99us,
this is far cheaper that the UK price..

Source record: 176105

Requiem (cm3hirjd@bs47c.staffs.ac.uk) wrote:
: I'm a graphic artist and to be honest the graphics in Starball are of a
: very high quality. There is hell of a lot more animation in them for a
: start and they consist of more than static pictures which is all
: obsession is, a few static screens, two flippers and a ball, oh and don't
: forget the 1 bitplane score at the bottom.

Well, I don't like the dark graphics in Starball, maybe that's why I
consider it of less quality?

: The Starball graphics have a very gigery appeal to them, they suit the
: gameplay very well. Therefore they are good graphics.

I don't like it...

: : 4: "more going on" are you on drugs? Compare the graphics quality!!!

: Yes lets compare them: Obsession, a few pictures scrolled up and down.
: Starball - the background, the aliens, the animation, the rotating ball,
: the intro screens, etc...

some 40 colours on screen at the same time, mixing bitplanes etc.
That consumes time. Besides, some of the effects in Starball isn't very
timeconsuming, the rotating ball for example, is a very easy thing to do.

: : 6: How do you rate games? You're like that lamer in a magazine I
: : recently read, who rated modems by the number of diods on the front!

: Games are rated on how much you enjoy playing them and I for one enjoy
: playing Starball a lot - I think that's why ST Format and ST Review rated
: it so highly, don't you think? Or are they lamers too?

Well, I apologise for that one, the story is true, but it was not fair,
since it is hardly lame to like a game.

: I agree with that, although Pinball Dreams is better than both.

From starball vs. Obsession to obsession vs. Pinball Dreams, where will
we end? :)

: > 4: "more going on" are you on drugs? Compare the graphics quality!!!

: Well, there's more sprites in Starball compared to the demo level of Obs.

Didn't mean to give the impression that Obsession has more 'happening' on
screen, just merely the fact that the graphics in obsession is timeconsuming.

: > 6: How do you rate games? You're like that lamer in a magazine I
: > recently read, who rated modems by the number of diods on the front!
: ^^^^^

: Now I don't mean to be hard on you, but surely you mean LEDs, not diodes????
: Maybe you're a little bit lame yourself ;-)

Well, diods is the swedish word for it, since english isn't my native
tongue I do make errors like that.

Try to translate "resistor" to swedish, isn't easy, is it? ;)

Hmmm......
Geeee
Imagine that, I can run apple 2 programs on my ST and PC
(gee and even MAC stuff with no sweat)

But wait you say, what does that have to do with ATARI and registers

about as much as 16/32 and 8 bit atari comparisons.
JW, please get your info straight.
8 bit atari programs are FAR different than ST programs.
ST programs are based on 32 and 16 bits not 8.

I think the poster was complaining about the paucity of 32 bit
registers in the P5 chip. NOT the speed (even us biased and
blind atari users can admit that a P5 is MUCH faster than a
8 mhz ST. (that is CPU SPEED not BITS JW)
I agree, IMHO that is part of the reason that INTEL CPU's
seem slower than same speed rated MOTOROLA CPU's.
(I prefered my ST to my 16mhz 386sx and then I bought a fast PC)
Think before you post (ie. don't let your ignorance show)
Matt

It isn't you who should start the telnetd or ftpd!
The tcp/ip daemons are started by inetd.
This daemon is listening on the tcp and udp ports. When someone tries to
get into your site via ftp or telnet, inetd starts the corresponding
daemon.

If like to try it out, just start

ftp localhost or
telnet localhost

Then you should get a connection to your own site.

It is possible. From the manual:

```
==============================================================================
Atari's MultiTOS has the ability to tell another application to take over
copy or formatting actions. DESK_KB2 translates those commands into a form
which KOBOLD understands. To activate it you have to set the appropriate
environment variables in the GEM.CNF file.

I own a Mega STE and have not experienced _any_ incompatibilities with the commercial programs I own (that is: Pure C, Pure Pascal, Adimens [I don't use it anymore -- too slow], Tempus Editor, Tempus Word, 1st Word plus [ditto], some chart software the name of which escapes me at the moment, Omikron Assembler and probably some more I forgot). There _are_ some incompabilities with certain freeware programs and probably games (I don't own any games).

First, I should mention that I do by no means agree with the
style or contents of Alfred's open letter. I can't understand
why he thinks he has the right to judge about John's work at Atari,
and even if by some magic he had the right, it's not very constructive
flaming John here. I hope that John won't be p*ssed off too much.
I appreciate that he still frequents c.s.a.s.

Anyway, I'm taking this opportunity to add a few comments and
questions.

John Townsend (John_Townsend@taligent.com) wrote:
> No, I am saying that TOS hasn't managed to live up with the rest of the

> with these operating systems.

The amazing thing about TOS is that although it is in many regards
a minimalistic system it still (and is) very usable. I always liked
the fact that TOS was lean&mean. I was amazed, for example, by the
extended control panel which added so much value and new possibilities
with so little code.

>In a way, yes.. I guess I am critical of my own work. The way I look at it
>is that I am critical of the history of TOS. Yes, I was a part of that history.
>No, I didn't have any decision making abilities during that history. I had
>little or no input into what direction TOS went. It was decided at higher
>levels than the system programmers group.

That's interesting. Does this imply that the "decision makers" at Atari
didn't think that system software was crucial for the success of
the computer line? I've always wondered where Atari tried to focus on in
those days, especially during 1985-1989. (I think that at the time
you seem to have been working on systems software at Atari it was
already pretty late to turn the situation around.)

> Using your logic, Atari didn't have good people. Atari had really good
> engineers. They didn't have enough of them though. Take a look at Apple.
> They have hundreds of engineers working on System 7 and System 8.
> Microsoft has hundreds working on Chicago. Atari can't compete with that.
> They only have a hand full of people and no matter how good they are,
> they can't compete with work that Apple and Microsoft can produce. There
> just aren't enough hours in the day.

Oh, so true. But wait a minute: There is also only a handful of people working on MagiC (not even full-time, as far as I know), the replacement TOS, but still MagiC is an excellent piece of software. They are even porting it to the Mac now. So you don't need a crew of hundreds of engineers for decent OS development - if you are determined to do it and focusing on a number of important things. I agree that MagiC still cannot compete with the major other operating systems, but it serves its purpose (fast, preemptive multitasking) very well, much better, IMHO, than MultiTOS ever did. (I'm not flaming MiNT, I like that piece of MultiTOS very much.)

In 1985, Atari led the industry by far both in terms of hardware (at the given price point) and systems software (only the Mac came close). The basic question is this: Why did Atari lose the lead although the ST was phenomally successfull in the first years and the money should have been there?

>Falcon030? Have any word processors, paint programs or other applications
>made it out for the commercial Falcon market? Thanks,

> >> Mark <<
>

just a few off the top of my head..

Games:

Ishar II, Ishar III, Transartica, Road Riot, Llamazap, Robinsons Requiem,
StoneAge. (not sure wether or not Steel Talons/Raiden are released yet..
should be though).. quite a few new ones coming though, but I wont list them
here..

graphics:

The stuff from Lexicor.. Prism Paint II, Xenomorph etc...
Da's graphic packages layout/picture
Chagall, Photostudio, Charly, Cloe, Morpher, TruePaint, Papillon

Word processors are not made for falcon only (why should the be?) but there
are loads out there: Atari Works, Papyrus, That's Write, Sygnum, Calamus...
and can't ignore NVDI3/Speedo5 which gives you truetype fonts..

for programmers there's not a lot of new stuff.. Hisoft's DSP assembler and
updated Devpack 3.10, Lattice 5.6, Brainstorm probably have updated their
series that never really went outside france though..

but it's sound that is the Falcons strongest side of course..

others can probably add to this list.

IMHO the situation isn't all bad really. The quality of most of the above is very good, and on the pd/shareware side of things Atari has always been pretty good and still is.

and one final thing for all the pentium pushers out there.. what's this I hear about a nasty bug in new pentiums (fdiv) that makes it useless as a number cruncher? :)

Cheers,

Torbjørn Ose - to@hihm.no

bull. The new software coming out now, almost always assume 386 or higher.
And the amount of software that run only on 386 or higher is enormous.
Software for the falcon? well, we all know about that....

>
> Keep Cool and Flying....

ACORN has releast a Risc PC, using the ARM 610 30 mhz Risc proccessor,
its one of there nice GUI machines, with a Option slott to fit a 486 PC card..

It can run graphics some 6 times faster than a 486 DX2 66....

It can even Mutitask Microsoft Windows with in its own OS, with the otional
PC card...

Acorn machines are used a lot in schools here, and you can get Real Unix for
these machines, in fact Acorn make Unix work stations....

The Fact is that the Acorns OS was Multitasking from day one, not just a add
on, they also support a Great Basic, its the best and fastest Basic in the
World...

This is the only machine other than the Atari that has its OS in Roms, plus it
has many things built into thier OS, Paint Programs, Text Editors etc...

One of the Best computers for School use, in fact the only Computer for School
use...

>Later a 68060-version will come out.

That seems to be a rather more realistic price than the Medusa - but I don't believe you will get 256MB of fast ram for that price, I think that will be how much COULD be installed if you had loads of wad to blow.

>2) 4 new Atari-CD's will come out soon.

For all us CDROM owning atari users :) - you have all got one haven't you?

>3) It is quite possible that Atari will be at CEBIT-95;

Bet it's only the Jaguar that they are displaying.

>4) they had some kind of "rumour-page" in the magazine, and there
>they were talking about a new Atari-computer called "Milan"

Well, although I love my falcon & enjoy using it, there is simply no way I could consider buying another Atari computer after the way they have behaved towards their existing users. I got better support for my ZX81 & Dragon32 than I did for my Falcon030. I got one of the very first batch of falcons to hit the UK - before any of the majors got them, and all the promises that atari made, all the blurb they span me when I bought it, the product lists they said were due for release, it all turned out to be lies. So even though its a nice machine, the support from Atari has been crap. They just don't want to know.....

Craig.

| marketing, in my opinion. Many ST users that I know have purchased
| because they had the chance to demo the program before they decided.
|
| Eva Crouse @ Compu Ware

Aye. The (almost undocumented) version of Write On! on the cover of ST format impressed me sufficiently that I registered it with Compo (mainly to get an AZERTY keyboard driver), and later upgraded to That' Write.

More recently, STF put KCS Omega in their cover and I admit I was less than chuffed, having just paid $$$$ for exactly the same version. Yes I have the docs, I know, but... OTOH I bet that cover-disc release made a lot of other people very happy.

And yes, development on KCS Omega does seem to have ceased. :[

Atari Web Pages Latest News
~~~~~ ~~~ ~~~~~ ~~~~~~ ~~~~

Version 1.0
~~~~~~~ ~~~

Date 22/11/92
~~~~ ~~~~~~~~

by

Mark Stephen Smith
~~~~ ~~~~~~~ ~~~~~

================================================================================

Foreword
~~~~~~~~

Hello and welcome to the first news item on the Atari Web pages. This document
will describe the Atari Web pages as provided by Mark Stephen Smith and will
inlcude a list of the latest updates for the month. Each month I hope to update
this text with the very latest additions and news on the Atari Web pages.

Hopefully these pages will provide an invaluable service to their users, but
they are still at an early stage and developing all the time. As such any
feedback and support you may have for these pages is more than welcome, it is
infact encouraged. The more input I get from its users the better, as then I
will know what is good and bad about these pages and can change them
approproately in the hope of increasing their value to their readers.

Now on with the show.

================================================================================

What are the Atari Web pages?
~~~~ ~~~ ~~~ ~~~~~ ~~~ ~~~~~

These are a collection of pages covering all formats of the Atari. In these
pages may be found the latest news, reviews, software for downloading, and
various other information and links to other places of interest to Atari users.

I have tried to make the structure of these pages easy to follow and as
intuitive as possible but there is still a lot of work to be done yet.

================================================================================

How do I access them and what is the Web?
~~~ ~~ ~ ~~~~~~ ~~~~ ~~~ ~~~~ ~~ ~~~ ~~~
```

First of all I shall look at what the Web is or to use its full name the World Wide Web. The Web is new way of accessing the Internet, unlike previous methods where you were required to enter commands into the program you were using the Web uses a more user driven method of getting around the Internet. This method is much more graphical than former methods and as such is much easier to get to grips with.

When using a Web browser (the name given to a program used to access Web pages) the control method usually consists of a point and click operation. A Web page will consist of text and graphics which are sometimes highlighted in some way to indicate that they are selectable and link to more information or a particular piece of data.

Such a link is reffered to as a hyperlink. In fact the whole system is a variation on hypertext and uses a script to create each page. Each script is written to a HTML (HyperText Markup Language) standard which contains the main body of text in the page and a few command tags for the browser as to how to format the page and what to do with links, etc.

Web pages may contain text, graphics, sounds, and animations, although the later two are normally supported through external software. It is also possible using the Web to gain access to newsgroups, ftp sites, and gopher services all through the one program. As such this makes this a very powerful tool for Internet access, and coupled with its ease of use this has suddenly became the big thing in the recent Internet explosion into the media.

Browsers can handle all properly written HTML scripts but may vary in operation when scripts are incorrect or contain mistakes. Browsers can be divided into to distinct types, graphical and text only. Popular graphical browsers include NCSA's Mosaic and the recent new browser NetScape. On the text side Lynx is the most popular textual browser (NOTE: text browsers don't show any form of graphics).

To access the Web you must either use one of the above mentioned browsers on a machine such as a Sun, PC or Mactintosh, or if you want to access it via your Atari you will need a copy of the Lynx browser as unfortunately there aren't any graphical browsers YET for the Atari.

Next month I will give full details on how to access the Web using the Atari.

==========

Where do I find the Atari Web page?
~~~~~ ~~ ~ ~~~~ ~~~ ~~~~~ ~~~ ~~~~

From your Web browser choose to open URL and enter the following address:

http://www.dl.ac.uk/MISC/ATARI/atari.html

If you can store a hotlist of addresses or something similar on your browser then it may be worth including this address for quick access in the future.

Once you've done that you should see my main page so I hope you enjoy it, and don't forget to write with your thoughts.
~~~~~

==========

What you will find in the Web pages every month.
~~~~ ~~~ ~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~ ~~~~~ ~~~~~

From the main menu you have several links available to you, some under miscellaneous and others specific to a particular machine, or collection of machines. First I will look at what will be in the Miscellaneous section.

****

Atari Related links, Documents, FAQ's and Newsletters
~~~~~ ~~~~~~~ ~~~~~ ~~~~~~~~~ ~~~~~ ~~~ ~~~~~~~~~~

First in the list are "Atari Related Links", these links are to other sources of Atari information or data (such as files, etc.).

There is a link to many of the major Atari holding FTP sites on the Internet. Links to several Web pages by different people on the Atari. This will grow as worthwhile sites come up. At the moment you can visit:

- HENSA to download Atari files (Moderated by Denesh Bhabuta)
- ZFC's Atari Pages by Annius V. Groenink. This has links to various Atari related places, along with talk of his own work on Edith and his new Drive U Project. Annius is also working on a version of the Mosaic browser for the Atari and the best of luck goes to him on that.
- Christer Gustavsson's Atari Gem Programmers Page. Very useful information for programmers grapling with Gem and the operating system. Also offers help via his questions answers page. Some links can be found to Atari related places.
- CAIN Atari Pages. CAIN is the Central Atari Information Network and they create a newsletter which is updately monthly on all things new to do with the Atari. There are also links available here.
- Martin Maisey's Atari Pages. Contains information (downloadable) on programs written by himself for the Atari. Again there are links to other Atari places.

This section has one or two more candidates for the near future when more work has been done on the owners pages.

Documents
~~~~~~~~~

Useful documents will appear in here. At the moment there is:

- Atari FTP List by Hallvard Tangeraas (essential for the latest news on who provides Atari FTP sites). This is updated in theses pages almost as soon as Hallvard changes it.
- Atari TOS Desktop Survival Kit by Thomas J Hopper. An essential guide to getting the most out of your DESKTOP.INF and NEWSDESK.INF files.
- Recommended list of software for the Atari by Denesh Bhabuta. List compiled by Denesh for me of his best software for the Atari (updates coming soon). Mostly PD and Shareware, this list contains links to download most of the software mentioned.
- Information on picture formats by Dave Bagget. Lots of information on the format of different picture files for the Atari.
~~~~~~~~~

FAQ's (Frequently Asked Questions)
~~~~~ ~~~~~~~~~~ ~~~~~ ~~~~~~~~~

Useful FAQ's will appear here. At the moment there is:

- Atari ST SLIP FAQ. This is a guide to connecting your Atari to a network. All you want to know about networks and the Atari.
- Atari CD FAQ. Information on getting and using CD's on the Atari. Regular updates to this can be found in my pages.
- GDOS FAQ by Gerd Castan. Got a question on GDOS then this is the place to look.

Newsletters
~~~~~~~~~~~

Although there may be more to come the following newsletters are updated promptly as I receive them:

- CAIN Newsletter containing the latest Atari news.
- HENSA Newsletter containing the latest updates to the HENSA Atari archive.

****

Questions and Answers
~~~~~~~~~ ~~~ ~~~~~~~

Submit your questions to here and get them included in this page. Answers are open to anyone who has something valid to say, and help is provided to me on Programming and Music questions by several knowledgeable sources. Please support this section, only by your interaction and questions will it survive. All answers are included in this page for anyone else with the same question and answers are also sent back to the person who submitted the question for those without Web access.

If you feel you have an expertise in a particular area concerning the Atari and would be willing to answer questions on that area when and if I submitted them to you, then please let me know and you can join the team. Programming and Music are fairly well covered and I can cover Graphics programs, help with Technical questions would be appreciated.

****

Reviews
~~~~~~~

Here I hope to include reviews of Atari products both new an old. So far I have the following reviews:

- Kobold review by Andy Curtis (ST Format)
- Flash 2 review by Frank Charlton (ST Format)

There are several reviews on the way by the above mentioned people aswell as some by myself (waiting to get hold of Apex Media for the Falcon). This section should hopefully include around ten or more reviews by Christmas.

Again if you feel you would like to submit reviews for inclusion then please write to me. Please note these pages don't include Lynx and Jaguar Reviews, as they are contained within their own pages.

****

Updates and Information on these Web Pages
~~~~~~~ ~~~ ~~~~~~~~~~ ~~ ~~~~~ ~~~ ~~~~~

All updates and news on the Atari Web pages goes in here. Previews of whats to come soon are included and new items or updates to the pages are listed according to date with the most recent being first. Most updates contain links to the new material for instant access.

Other things to be found in here are the number of accesses to the Atari pages. At the moment this is out of date, but I hope soon to have this updated on either a monthly or even weekly basis.

****

This now concludes the Miscellaneous section. Now onto the Other Pages. These pages are specific to a particular machine, or collection of machines. These are going to go through some major changes and you can expect a fair number of changes to be made to these in the next month or so.

****

Falcon Page
~~~~~~ ~~~~

This will contain information and files relevant to the Atari Falcon, currently this page is divided into the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

In here expect to see any news or previews that come my way, whether they be small descriptions or full features with pictures. At the moment there is:

- Apex News. This contains some information I got on Apex Media for the Falcon when I spoke to Douglas Little on the phone a few weeks back. Not very detailed unfortunately, but I'm waiting on my copy of Apex to give a full review so expect that to be rectified soon.
- Dextrous News. Small description of some of the features of Dextrous with a picture. Only at an early stage of development, if I hear more it will go in here.
- Towers II : Plight of the Stargazer. Pictures and description of this great looking Falcon only sequel to Towers. Expect the demo soon.
- Newsletters from HENSA on Falcon section of archive.

Misc
~~~~

Miscellaneous information on the Falcon, including:

- Falcon Demo FAQ. List of Demos for the Falcon, including some form of information on each.
- Compatibility list of games with Falcon.
- Compatibility list of applications with Falcon.

New Software
~~~ ~~~~~~~~

The latest Falcon/enhanced software available for download. Major revisions to be done with updates here. At the moment the following software is included, with more to come:

- Play MPEG v0.68 by M.D.Griffths (shareware)
- Speed of Light v3.5 (shareware picture viewer)
- FOG issue 6 diskmagazine for Falcon
- Scape a planetary landsacpe generator.
- Digital Tracker demo of commercial version.
- Obsession 1 level demo.

Other software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth using on the Falcon.

- Backward v2.52. For compatibility with the ST. Please send any versions which are newer than this.
- MultiBlow. Configurable overscan utility.
- Starball. Excellent pinball game (Falcon enhanced).
- Berzerk. Excellent version of Berzerk (Faster on Falcon).

****

Atari ST/STE/TT/Mega STE Page
~~~~~ ~~~~~~~~~~~~~~~~~ ~~~~

This will contain information and files relevant to all the above mentioned Atari formats, currently this page is divided into the following areas:

News
~~~~

In here expect to see any news or previews that come my way, whether they are small descriptions or full features with pictures. At the moment there is:

- Newsletters from HENSA on TOS section of archive.

New Software
~~~ ~~~~~~~~

The latest (most recent versions) software available for download. Major revisions to be done with updates. At the moment the following software is included, with lots more to come:

- Speed of Light v3.5 (shareware picture viewer).
- ST Zip v2.6. Latest version of ST Zip.
- Obsession demo. 1 level of this great pinball game.
~~~

Other Software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth having on the Atari.

- Ozone. Good platform/puzzler.
- Starball. Excellent pinball game.
- Berzerk. Excellent version of Berzerk.

****

Lynx Page
~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News
~~~~

News on the Lynx and related material. At the moment there is:

- Lynx Summer Steal Deal Extended to the Fall. News of price reductions for a limited period.

Reviews
~~~~~~~

Reviews for just about every Lynx game ever released will appear in here. All reviews are by Robert Jung. At the moment the following reviews are included:

APB Awesome Golf Baseball Heroes
Batman Returns Basket Brawl Bill and Ted's
BlockOut BattleWheels Blue Lightning
California Games Checkered Flag Chip's Challenge
Crystal Mines II Dino Olympics Dirty Larry:Renegade Cop
Dracula the Undead Double Dragon Desert Strike
Electro Cop European Soccer Chal. Ultimate Chess Chal.
Gauntlet:3rd Encounter Gordo 106 Hard Driven'
Hockey Hydra Ishido : Way of Stones
Jimmy Conners' Tennis Joust

Other Lynx Stuff
~~~~~ ~~~~ ~~~~~

Other items of interest to Lynx owners. At the moment there is the following:

- Lynx FAQ

New Software Anouncement
~~~ ~~~~~~~~ ~~~~~~~~~~~

Currently holds news of Bouble Trouble and Super Off-Road for the Lynx. Expect reviews soon.

****

Jaguar Page
~~~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

All the latest news and preview information I can find related to the Jaguar. Although empty at the moment expect this to fill up very soon (lots to come).

Reviews
~~~~~~~

A collection of reviews from different sources, hopefully I will be contributing more to this section myself. Reviews so far include:

Aliens versus Predator Raiden Tempest 2000
Cybermorph

There are many more reviews to come.

Other Jaguar Stuff
~~~~~ ~~~~~~ ~~~~~

Miscellaneous information on the Jaguar. Information included presently is:

- Jaguar FAQ
- Raiden Tips
- Jaguar Game Cheats
- Kasumi Ninja FAQ
- Ultra Vortex FAQ

Other Jaguar Pages
~~~~~ ~~~~~~ ~~~~~

Other pages specific to the Jaguar included in here. Currently there is:

- Atari Jaguar Homepage by Nils Jacobsen

There are others that will be included, some containing more recent news, but the one above is the most organised and intuitive one I've came across.

****

8 Bit Atari Page by Ivo van Poorten
~ ~~~ ~~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~~~

Not maintained by me these pages cover the 8 bit formats of Atari machines and are very comprehensive. Nearly everything you could hope to find is contained within these pages.

****

What to expect in the future
~~~~ ~~ ~~~~~~ ~~ ~~~ ~~~~~~

Some structural changes are likely to appear in the next months. I will be introducing an announcements page where you can tell the World of anything you have to announce. Please send news of updates to your programs, Atari stuff for sale, and any other Atari announcements here (NOTE : Commercial companies should send information on products to be included in here and in the news sections).

Also coming soon will be a monthly editorial. In this I will try and sum up the month past and to give my opinions on how I saw things for Atari at that time. Hopefully I will be able to look back over many good developments in my pages and summarise them as they happened.

There is an outside possibility of starting a programmers and MIDI section in these pages but this is as yet undecided. I will judge whether or not to do this based on the kind of response I have. I do not want to repeat any of the good work done in these fields however by other Web page writers such as Christer Gustavsson.

More support is needed for the questions and answers pages, although initially successfull people just stopped posting their questions. Although the odd one is still coming and answers are still forthcoming. Please support this, it is of benefit to anyone who uses it.

The Jaguar section should have a lot more news, pictures and reviews in the future. I now own a Jaguar and will soon be writing a review for Aliens vs Predator. I have tracked down a fair bit of news and am in contact with a few companies now and hope to get news from them on there products.

Extra pictures will appear due to my recent access to a colour scanner, enabling me to scan the latest pictures before the exist elsewhere on the Internet. I also hope to slowly get all the maps for AvP into these pages somehow?

Both the ST and Falcon sections should contain much more news in the future, along with more of the best PD/Shareware, and PD/Shareware reviews. I should have several demos hopefully in the near future for games coming out on these formats.

The Lynx section is to continue to get reviews and I will update the news as and when I get it.

Expect more links to Atari related pages in the future, aswell as links to all the Atari related newsgroups. There will be more newsletters, documents, updates to the FAQ's, I hope to include AEO soon also.

Expect further reviews from Andy and Frank, along with myself (watch out for the Apex Media review). Hopefully I can include more screenshots, and do a few program tutorials.

Last but not least, after Christmas I may set up a feedback page, where you can send your feedback via a Web form. Until then please write with your ideas, critisms, comments, submissions (software, news, reviews, questions, etc), to me and don't forget that I am now the official maintainer of the Atari FTP list originally by Hallvard Tangeraas. All updates to this list should now be sent to me.

Thank you and see you with the updates to these pages next month!

3814. MiNT1.12+MinixFS problem

Newsgroup: comp.sys.atari.st
Date: 1994-11-24 13:18:49 UTC
From: cgra@se.bel.alcbel.be
Message-ID: <3b23rp$m0n@btmplq.god.bel.alcatel.be>
Source record: 176132

Hi all,

(hi Eric?:>),

I slotted the MiNT 1.12 binary into my Falcon and it seems to work fine.
There seem to be some conflicts with VRAM, but then the old MiNT (1.04)
refused to work with VRAM at all... can anyone comment on MiNT/VRAM, BTW?

Funny thing is, I have minix.xfs sitting in my root directory (C:\) and
MiNT 1.12 just seems to ignore it. I don't see any announcement from
MinixFS at all. (Ditto for the CD-ROM driver from the ICD Pro Tools,
which I won't mention because it's a pirate copy. Look if it works under
MiNT 1.12 I'll buy a legit. copy, OK?)

Roger Sheppard. (sheppard_r@kosmos.wcc.govt.nz) wrote:
: Well any one from ST-Review reading this, well the price has just jumped
: up over here and for what is in this mag I will be droping it at the end
: of this year, as its far to dear here for what it contains, may be its
: ok if your are into Midi or Grpahics/DTP, but very few Falcons and TT have
: been sold here, their is far to much emphasis on Graphics in this mag..

Roger, i suggest that you do what i do, and that is subscribe to the mag
in Aus dollars it works out to be about $120 a year. If I was to go into
a shop here and buy it, they (the shop) charge anything from $15 - $18
a copy depending on how many cover disks are attached.

: My current opinion of the magazine its more for Falcon/TT users and with this
: massive price hike its no longer in my lead...

In some instances i agree, but I still find plenty of stuff of interest
as regards the ST.

: Can some one explain the Overseas price quoted on the cover of 4.5UKP,
: as its being sold hear at $19.75, far over the exchange rate of 2.5 times the
: UK pound....

: So ST Review, drop the price, remove those stupid cover disks, (ST-World never
: had them) and have reviews articles for the average Atari user...

I would blame your local importer and not ST REVIEW for your problems with
the cost of the mag.

: My Subs (local) stop in December....

Good, get if from the UK, it will save you heeps

> and Croolis Var's ? Whos planet gets the torpedo? hehehe (g)

I think I blew both of them up in the end... :) heheheh.
Try asking the buggol about the numbers and clones and youself. He'll go
rambling through a whole string of stuff but eventually give you the coords
of a few numbers. And they will give coords of the others if you treat em
right.

Consider also transporting the buggol to another planet - this upsets him
a bit and he'll either tell you anything to get you to take him back or
clam up completely...

3817. Probs with TeraDesk

Newsgroup: comp.sys.atari.st
Date: 1994-11-24 13:45:11 UTC
From: st39@unix.brighton.ac.uk
Message-ID: <1994Nov24.134511.25439@unix.brighton.ac.uk>
Source record: 176140

I'm having problems with the latest English version of TeraDesk (1.40?), it has problems running software that detects if you're running it from GEM or TOS.

For example, if you run STZIP from a command line (TOS) then you get the text version, if you double click on the same program in GEM then you get nice graphics etc...

TeraDesk seems to tell everything that you're in a command line, so STZIP displays a load of text instead of nice graphics.

Anyone else had this problem?

3818. IDE Harddisk and TT, possible?

Newsgroup: comp.sys.atari.st
Date: 1994-11-24 13:51:19 UTC
From: vongunten@eicn.etna.ch
Message-ID: <1994Nov24.135119.858@neli00>
Source record: 176137
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

A friend of mine wants to know if it is (easily) possible to connect an IDE harddisk into a TT. He got a drive (120MB) from a PC where this size was becoming too small...

(I believe there's an SCSI port, but no IDE inside the TT?)

Reply by E-mail preferred, please... Thanks

3819. CLA version 3 : Beta testers needed.

Newsgroup: comp.sys.atari.st
Date: 1994-11-24 14:39:10 UTC
From: Craig Graham <Craig.Graham@ncl.ac.uk>
Message-ID: <3b28ie$qoc@whitbeck.ncl.ac.uk>
Source record: 176141

I now have an early beta test of version 3 of the CLA digital design system.

As it has been re-written from scratch, this is only the schematic capture module, without the simulation & GDOS support of v2r?.

I need a few beta testers who can assess my new approach to the GUI for me, as it now follows Windows & Modern GEM conventions a lot more than v2r? ever did.

Current limitations:

o v3 only runs on colour systems > 640*400 res. Mono support will be added later, but for now no ST-High users need contact me.

o The current binary is 68030 only, but if anyone has a MegaST with a good enough gfx card, I would be happy to compile a 68000 binary.

If you feel you can test this for me, please contact me in email.

Craig.

Ah yes! now I remember...
Hours of sadistic fun can be had here.

I quite like transporting someone to the ship, and then let them watch as
I blow up their world. (Then I take them to another place, drop them down
and then blow them up!)

Quite satisfying after a bust day at work! :)

Neven Petrlik (npetrlik@public.srce.hr) wrote:

: Is there any software (program) support for ST
: that i can use all the goodies of the Internet ?
There are some....but you will need a SLIP link to your provider...

: When i try to start for expl. mosaic
: unix says 'cannot open display' or something
That is because it is looking for the display (ie screen) which it
can't find, as you are logged in from your Atari, and not from a
X-Terminal connected to the Service provider's network.

Also, you are not running Unix, and the program will only work on a
Unix machine...

You can browse the internet, using a vt100 text browser for WWW. This a
program called lynx...and you can just start the program on the service
providers computer

: Does exist some support for ST that i
: should normally use the programs on my host
: (i mean programs like Mosaic, WWW, Usenet, irc ..) ?

A mosaic type program is under development, if everything turns out
fine. There exists Lynx for the ST/Falcon/TT, and you will need a slip
link, as well as to be running MiNT and MiNT-Net. There is also KA9Q
which gives you a SLIP program with some tools such as ftp, and telnet.
I'm not too sure, but I think there are telnet, ftp and gopher clients
for the Atari computers, to be used with MiNT.

Lately I talked to one of the developers on the phone, and he told me
that there is almost no increase in acceleration compared with NVDI 2.51.
(This, of course, only applies to the "normal" VDI part. You cannot
compare the font scaler since there was none in NVDI 2.51.)

Hi Aatri-Freaks

For backups of my Harrddisk I use the zip- or zoo-compression programs. But somtimes the resulting archive is too large for ONE floppy disk (ap. 700 k). Is there anywhere a good mint-friendly program, which can split a large file in two, three our more 700k-Files? And - of course - then I need a programm zu concaternate the splitted Files for restoring again.

Or is there any archiver around, which can split the archive in several parts for floppy-disks at it self?

Ciao, Arnt

Here's something, there are all quite recent packages:
(some of these work on any Atari, but on Falcon really well..)

Papyrus (Gold) -- word processor/DTP with vector fonts, very fast.
NVDI 3 -- Speeds up the graphics (300-800%) + gives Truetype
font system.
SpeedoGDOS 5 -- Like Adobe type Manager. Adobe Type 1,
GDOS & truetype fonts.
Studio Photo -- Image manipulation / retouching (uses JPEG/DSP)
Chagall -- Image Manipulation / retouching / drawing.
Calamus SL -- Professional, modular DTP-system.
Xenomorph 2 -- High-level rendering package.
DMD Edge 1.10 -- Hard disk defragmenter etc.
Inshape -- 3D object design + high class rendering (needs 68882).
ICD Pro -- Hard disk utilities.
NeoDesk 4 -- Desktop replacement.
SoundPool Datadat -- Backup you hard disk to DAT via FDI.
DA's Vector (pro) -- Vector drawing/ animation / font manipulation.
DA's Picture -- Photo manipulation / drawing.
Interface -- Colour RSC -editing.
Kobold 2 -- Ultrafast copying & formatting.
True Paint -- Graphics.
Papillon -- Document processor / drawing.
Redacteur 3+ -- DTP / text processing.
Atari Works -- Business progs.
Shift II -- Database with sound & pictures
Outside -- Virtual memory manager.
Midnight II -- Screensaver like After dark.
Morpher -- Morphing package / animation.
Signum! 2 -- Text processor / DTP.
Script 3.5 -- Text processor.
RayStart -- Raytracing
BlowUp 030

Walter Hellman (hellman@teleport.com) wrote:
: Hello All,
: What simms are needed to take a 1 meg STE to 4 meg? Is there anything
: special about the installation? Is there any software follow-up needed?
: Does anyone know of on-line instructions for the upgrade posted
: anywhere?
: Thanks for any help.
: Walter

Get 4 1 meg SIMMs (PC or MAC, doesn't matter.)
Open STe
Remove 4 256k SIMMs
Install 4 1 meg SIMMs
Close up STe
All done
PERIOD.

Matija Grabnar (Matija.Grabnar@ijs.si) wrote:
: >When MiNT 1.11 is released in binary form (very soon) it will work with
: >the ROM AES, apparently even with memory protection switched on.
: Well, I don't know about version 1.11, but something called MiNT 1.12
: (yes, one-twelve) has appeared on several of the major ftp servers.
: The three archives contain source, docs and BINARIES.

Yes, that's right. What happened is that Eric decided that so many changes had been made to the original MiNT 1.11 and it had been so widely distributed that it would be appropriate to denote the new release 1.12. As to the ROM AES thing, I haven't actually tried it yet as it works beautifully with the multitasking AESs.

: I tried it, and somehow it _seems_ considerably faster than the old MiNTs,
: but that could be because I haven't run it for so long.

It's certainly very nice.

>Thanks.
>

Hi.
There could be a number of problems here. Has the computer stopped working only since the memory upgrade? If so, it's possible that your SIMM chips aren't properly plugged in - they may be slightly loose. If you're not afraid to lift the lid of your ST, you could check, and make absolutely sure that the chips are properly plugged in. If you got your upgrade fitted by a dealer, take your computer back to him/her and explain what you think is wrong.

If it's nothing to do with the SIMMs (i.e the problem started long after the memory upgrade), There could be a problem with the TV Modulator. In fact, my ST did something similar to what you described above, so I had a look inside, and found that something was rattling. It turned out that part of the metal shielding hadn't been screwed on properly after I sent it to get fixed (an unrelated problem), and this little square piece of metal had been floating around inside my ST for weeks.
One day I switched it on, and I got a stripy (sometimes black) screen. The disk drive was being read correctly, and it turned out that the metal had got into the modulator somehow... I was quite lucky, I suppose - It could have been much worse....

Hope I've helped some.

Brian

3858. Falcon & wind_close

Newsgroup: comp.sys.atari.st
Date: 1994-11-24 21:28:27 UTC
From: curis@clipper.ens.fr
Message-ID: <3b30hr$gsi@nef.ens.fr>
Source record: 176175

I'm a user of Falcon ,and C & GfA Programmer. I've noticed a strange metter with wind_open and wind_create: on my TOS version (4.04 french), it seems to be impossible to open
and close the same window more than 15 times. When i do a programm which creates a window, and
then open and close it, i've got two bombs. Same thing when i create and delete it 15 times.
There's no matter with Mega-STE TOS or TOS 1.0, and it works fine with MultiTOS.
Does anybody knows why ?

The programm, in C, was :

```
/* init GEM & VDI */
/* create the window /*

for(i=0;i<50;i++)
{
wind_open(handle);
printf("%de ouverture de la fenetre %d",i,handle);
wind_close(handle);
}
```

I made it because i had strange bombings in one of my programms and didn't understood why, so I imagined it to test if it was me or the TOS.
Sorry if there are mistakes, I don't speak English very often.

Emmanuel CURIS
curis@roxane.ens.fr

3859. Victoria B.C. Canada

I left a message here about a year ago, but have since lost/misplaced the info right at the point where I can do something about it

I would like to knoww if there is an Atari User Groups in/near Victoria, British Columbia, Canada. If so: Is there a BBS associated with it, meetings, newsletters, flea markets, user-to-user support,...
If anyone knows of such a user group, a contact e-mail address or tel. phone number, address would be greatly appreciated.
Merci
-ken

>As far as producing shareware is concerned, typically I don't expect any
>amount of quality, but of course it never hurts when I see something of
>extremely good quality come out of the Shareware market.

And in fact, some of the best software ever released on the Atari is shareware.
Look at Kandinsky, ST-GUIDE, GEMVIEW (only surpassed by one progam I've ever
seen - xv on the HP apollo700), CLA :) , OPUS (sadly no longer supported,
but still a good spreadsheet), and many more...

>product it is and how well people like it and how popular it becomes. Me, I
>produce Shareware not because I hope to get rich off it -- I'd be a fool to
>think that -- but because I enjoy the software I write -- I write software
>that I myself want to use/play.
> And that itself makes it worth it.

Amen. Recieving the registration fee is wonderful, not because of the money,
but because it lets you know that people have appreciated your work and
think enough of it to send you the cash. Even recieving a letter or two
is good, and can spur you on to make things better.

And of course, I for one, always ensure that my registered users get
updates way before the rest of the world (in fact they are the only
ones who have the more recent versions of my stuff).

My favourite thing along those lines was when a guy from Canada wrote
to me telling me how his kids really enjoyed playing a game I wrote
(not a very good one, but it was the best I could do when I was 14).
I'd forgotten all about it, but that letter left me wandering around
with a grin on my face for days......

And no, I haven't made a fortune either - maybe the PC version of CLA3
will make more than the ST one did (don't worry, not abbandoning Atari,
just expanding my market a bit).

Craig.

From: Hendrik_Mylius@pb2.maus.de
Message-ID: <199411250046.a11789@pb2.maus.de>
Source record: 176053

On Saturday November 19th at about five past one
der@discovery.UUCP (*Daniel Eriksson*) happened to write:

DE>2. Get one of those TOS-cards that comes with an IDE-interface plus a
DE>IDE CD-ROM. This is probably the cheapest solution.

Whoaah, careful with that one!

Those cheap PC CD-ROMS do not have a standard IDE interface. Those interfaces
are vendor-specific, e. g. Sony, Philips, or Mitsumi. The Mitsumi FX01?-series
are such drives. It works fine on soundblasters and stuff but would not work
with a real IDE-adaptor.

AFAIK there is only one real IDE-CD-ROM available at the moment, the Mitsumi
FX300 (not 100% sure about the model-name).

The standard SCSI-drives work fine. Esp. TOSHIBAs with ICD-adaptors provide
all common CD-modes and digital copying of the Audio-data via SCSI! (If you
have the right driver, that is ;-)

DE>You also need driver-software in order to use the unit. Personally I
DE>use CD-Tools from Hard&Soft in Germany to accompany my SCSI2 CD-ROM

Best there is ;-) A brand new version 2.0 is out now. This version supports
IDE-CD-ROM as well! And it comes with a new MetaDOS.

> *know* for sure ? ...and more to the point...if it *is* true, what
> are Atari intending to do with them ? Surely they can't scrap them
> ?!?!

Its one of those ever recurring stories. Back in the late 80's I think people actually believed it. However nowaydays it just doesn't make sense. Atari have dumped as much of there ST stock as possible. They have even built their spares inventory into working machines IIRC. So it just seems unlikely that they would hang onto 2000 CD-ROMs. They weren't particularly good CD-ROMs even then if the magazine reviews were anything to go by.

Roland.

3866. COMPUTE! Back Issues for sale... CHEAP!!!!

Newsgroup: comp.sys.atari.st
Date: 1994-11-25 00:30:52 UTC
From: kwwong@lynx.dac.neu.edu
Message-ID: <3b3b7s$9jb@chaos.dac.neu.edu>
Source record: 176183

These are the back issues of COMPUTE! magazines prior to when the publication went all-software-review-only. Each back issue has great type in programs for all sorts of computers including IBM, Apple, Commodore, Amiga, and Atari. I'd buy these BECAUSE OF THE GAMES!!! :-)

December 1985: SPEEDSCRIPT revisited; enhancements to SpeedScript 3.0 ... BALLOON CRAZY, exciting arcade game for Commodore 64/128, Atari, Apple, IBM PC/PCjr, TI ... Atari Fine Scrolling - secrets of advanced Atari graphics ... Commodore 128 Video - design your own custom characters ... Million Color Palette for PC & PCjr - create extra colors without extra hardware ... Apple Disk Booster - increase disk capacity with this short program. (Asking price: negotiable)

March 1986: SWITCHBOX - electric pachinko game for Commodore 64, 128, Amiga, Atari, Atari ST, Apple, and IBM PC/PCjr ... MULTIMEMORY for 64 and Apple - load several BASIC programs at once ... Atari Bootstuffer - fit 10 Boot programs on a single disk! ... IBM Fractal Graphics - fascinating images with a new math ... BASIC Sound On the Atari ST - how to make music and sound effects ... Requester Windows in Amiga BASIC - add professional features to your own programs. (Asking price: negotiable)

April 1986: Adding Power to ST BASIC - valuable techniques for Atari programmers ... Apple Hi-Res Graphics - mix, flip, and copy high-resolution screens ... 64 Screen Genie - A magic method for character graphics ... AmigaDOS Batch Files - take control of your Amiga ... Atari FontMaker - design your own custom characters. (Asking price: negotiable)

May 1986: HICKORY, DICKORY, DOCK - and educational game for Commodore 64 and 128, Atari, Apple, Atari ST, Amiga, and IBM PC/PCjr ... Managing Files From Atari ST BASIC - a major book excerpt ... Better Branching In AppleSoft - computed GOTO and GOSUB ... 64 Autobooter - make disk programs run automatically ... Atari DEBUT - add commands to BASIC for easy debugging ... MODified Shapes for IBM ... Amiga Puzzle - learn new Amiga BASIC progamming techniques. (Asking price: negotiable)

December 1986: LASER STRIKE - a challenging one- or two-player stategy game for Apple, Amiga, Atari, Commodore 64, IBM PC/PCjr, and ST ... Mail Merge And Word Count - two productivity tools for Commodore 64 Speedscript ... APple Math Graphics - dazzling screen displays with one program line ... Fontier 128 - a comprehensive 80-column character editor for the Commodore 128 ... Atari DOS Switcher - an instant DOS menu whenever you need it. (Asking price: negotiable)

January 1987: CHAIN REACTION - an explosive strategy game for Amiga, Apple, Atari, Commodore 64, IBM PC/PCjr, and ST ... FastKey For The Commodore 64 - entire lines of BASIC with only a few keystrokes ... Printer Master For Apple - easily access and cutomize all your printer's features ... Disk Fix And Quick Screen - two handy utilities for IBM PC/PCjr ... ML Write For Atari - convert machine language into DATA statements ... XMODEM File Transfer for Commodore 128 And 64 ... Apple DOS 3.3 Wildcards ... Music Maker 64. (Asking price: negotiable)

February 1987: WARI - a challenging, ancient AFrican strategy game for the Amiga, Apple, Atari, IBM PC/PCjr, Commodore 64, and ST ...File Compressor For The 64 - crunch files for faster transfers and more disk space ... Well-Behaved Batch Files - more flexible, interactive batch processing for IBM PC/PCjr and compatibles ... Amiga Jigsaw - An absorbing graphics puzzle ... 64 Label Master - custom hi-res graphics for printer labels ... Quick ProDOS Catalog for Apple II ... Full-Screen Shell Sort For ST BASIC ... Atari SpeedScript Customizer. (Asking price: negotiable)

March 1987: EUCHRE - an absorbing version of the popular card game for Commodore 64, Amiga, Apple, II, PC/PCjr, and Atari ... Applecoder - hide your private files from prying eyes ... Filedump For IBM PC/PCjr - examine your disk files in detail ... Custom Characters For Atari XL and XE - an efficient way to make your own character sets ... DOS Calc For The 64 - work with your disks the easy way ... 3-D Surfaces For Amiga - create 3-D shapes in any color combination ... Diskcheck - Powerful Apple sector editor for DOS 3.3 ... 128 File Viewer - a fast, multipurpose disk utility. (Asking price: negotiable)

April 1987: SPEEDSCRIPT 80 - our powerful, full-featured 80-column word processor now for Apple IIe, IIc, and IIgs ... MENU PLANNER - plan meals effectively with this easy-to-use program for the Commodore 64, IBM PC/PCjr, Apple, ST, Amiga, and Atari ... MAGAZINE INDEXER - A specialized database for the IBM PC/PCjr, Atari ST, and Apple ... Hyperscan - stunning, high-speed graphics for the Commodore 64 ... Disk COMpacker For IBM PC/PCjr - conserve disk space and simplify directories ... Easy BASIC Autoboot For Atari ... Amiga Fonts - slect system fonts and text styles under program control from BASIC ... Merge 128. (Asking price: negotiable)

July 1987: WEATHER WIZARD - a forecaster for IBM PC/PCjr and compatibles, Commodore 64, Amiga, Atari ST, Apple II, Atari 400/800/XL/XE ... PFkey 64 - add powerful BASIC 7.0 commands and functions to the 64 ... P/M Magic For Atari - complete control over arcade-quality graphics and animation ... IBM Printer Control - customize printer control codes easily from DOS ... Sprite Designer - an easy-to-use, full-featured sprite editor for Commodore 64 ... Converter - Apple graphics conversion utility for Print Ship ... Medium-Resolution Autorun For Atari ST ... Disk Expander For Apple II. (Asking price: negotiable)

November 1987: THE HERMIT - explore a mysterious underground world in this exciting text adventure for the Commodore 64, IBM PC/PCjr, Apple II

series, Amiga, and Atari ... IBM Directory Menu - load, run, rename, or delte files at the touch of a key ... Dynamic Graphics For The 64 - Lightning-fast hi-res graphics from BASIC ... Chrome II - powerful double hi-res commpands for Applesoft. (Asking price: negotiable)

I strongly recommend all 11 issues if you are on a tight budget. :-)

NOTE: Buy ALL 11 back issues at $10, I will pay shipping!!!

(Well worth the price with all the programs you can have here)

E-mail me if you are interested.

-Kwong

Some (not many, these days) modems have the little DIN-8 plug on them specifically intended for the standard Mac modem port (and thus standard Mac modem/printer cables). This would still not prevent their use on ST machines, but you would probably have a hard time finding the correct adaptor cable.

Most companies that bundle up modems for Macs just include a DIN-8 to RS232 adaptor cable (the exact opposite cable one would need to hook a DIN-8 modem to an ST), and sell regular RS232 interface modems.

One of the exceptions is the TT version of Revenge of the Mutant Camels
(one of the top 10 shoot'em up games of all time, bar none, IMHO). Llamasoft
(Jeff Minter's shareware registration organization) is still in business,
and should be able to supply you with the TT version of this great game.
The registration fee is probably 5 pounds, dirt cheap. See the doc file from
the standard shareware release for details (on atari.archive.umich.edu, in
/Games somewhere). There is also an STE only version, I seem to recall.

You KILLED YOUR LITTLE COMPUTER PERSON!?! You, sir, are a ghoul. :-)

Actually, I'm amazed that you succeeded. In the interests of science, I starved/thirsted my computer person for several days once, and all he did was get green in the face, puttering around scowling at me (the dog was really irate as well, lots of barking).

> Oh and get him to play on his computer, its dead funny...
> and he will take a bath/shower and do alsorts of things..
> He will play board games with you, or is it card games???

Ok, here we go (from the docs):

ctrl-f - food delivered to door
ctrl-w - fills water tank a bit
ctrl-a - rings alarm clock
ctrl-d - dog food delivered to door
ctrl-c - phone call
ctrl-p - physical contact, petting (person must be seated in the easy chair)

Some example messages you can type:

please type me a letter
please light a fire
please play with your computer (cool one)
please play a game with me

Generally, look around the screen and ask him to do things with the stuff in his house (tv, stereo, piano, shower, etc. etc.).

> If you manage to kill the dog you're a better master than I was :-)

<unspeakable comment deleted>

The funniest thing I remember happening with respect to this program occured while I was playing a game with him. Right in the middle of the game, he got up, walked upstairs (I'm wondering what the hell he is doing at this point), goes into the bathroom, and comes out a few minutes later to resume the game. Great little program, this.

It may sound like a stupid question, but a magazine I read a while ago suggested that Atari was going to dissolve Atari UK. Is it still in existence? With all the other "office closing" Atari's done since 1991, I hope that they'll at least keep Atari UK open. Also ... just out of curiosity, how many offices has Atari shut down? I've heard Australia, Canada and Germany all got the axe. Any others?

Thanks!

3876. Spectre 3.0 dedication page

Newsgroup: comp.sys.atari.st
Date: 1994-11-25 03:26:05 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <3b3lgd$d34@mailer.fsu.edu>
Source record: 176197
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Quick question: How does one invoke the "secret dedication page" in Spectre 3.0? I have read about the thing (past versions played some sort of sample), but I have never figured out how to do it with 3.0. Just curious...

> to notice!?)

You must be kidding... The Falcon is capable of 8(!)-channel 50 KHz 16-bit digital audio, as proven by software like Steinberg's Cubase Audio and Emagic's Logic Audio. Providing the harddisk can cope with the _huge_ amount of data, of course. (But if your PC doesn't have a PCI-bus or similar _and_ a SCSI-controller the falcon is *definitely* better equipped for this, because of special optimised hardware for that task). During recording or playback the DSP is still free and can be used for, for instance, reverb (yes, on all channels simultaneously)

The latest version of Cubase Audio does even support 16 (!!!) channel digital audio at 13 bits (instead of 16 bit) and still at 50 KHz (or, more useful, either 44.1 or 48 KHz).

Anyone who can do that on a PC without investing some 7000 US Dollar (heck, even *with* this investment I don't think one can do it :-P) please say so, I am really interested.

So at least there's _something_ a Falcon can do much better than the competition ;-)

Two extra pins...

> About accelerators, well, I'm personally not very fond of all those
> "fake"-accelerators out there, all they do is to double the CPU-clock,
> and who knows how long that will work?

I have a High-Speed 40 accelerator built-in (I think that is the same as
the "Speed-Resolution card) with which I get 105 % the Speed of a TT 030.
I use it now for some 4 months 12 hrs a day and it is very reliable.
(It also did run about 260 hrs non-stop rendering a 3-D animation)

> Get an accelerator with a CPU on the expansion-board, Mighty Sonic for
> example, it costs a little more, but it is worth it, you get a 32 MHz

> FPU socket.

I don't agree, I used the Eagle Sonic (without FastRam :-( ) and because
the cache of the 68030 is very small (1024 bytes ?) you don't get a much
faster system, only about 35 % faster. But maybe with FastRam that figure
improves dramatically, I don't know. But the 030 / 32 Mhz card with
FastRam is quite expensive...
With the card I use now, see above, the speed of the entire motherboard

goes from 16 to 20 MHz. And that makes a _lot_ of difference (believe it)

> Yes, it is possible to disconnect the bassbost and everything else on the

I do those modifications for a living, but I suppose you can find someone
located a bit closer to you. Amsterdam is somewhat far away...

Even worse, building such a board is utterly impossible unless you're into designing a custom PCB with some 6 (FAST) TTL-IC's, and like to have your system hang every now and then because of timing-problems...
(I tried something similar in a ST once some 3 years ago)

3880. Re: Doom & AvP not all that great

Newsgroup: comp.sys.atari.st
Date: 1994-11-25 04:50:15 UTC
From: mrathwel@uoguelph.ca
Message-ID: <3b3qe7$vk@nermal.cs.uoguelph.ca>
Source record: 176198

```
: Those that have Jags have probably noticed that except for startup screens and
: such, everything seems to be done in 320x240 (approximately) instead of the
: full resolution, what a bummer. AvP is also *not* 24bit for the most part. It
: looks more like 8bit (look at the 'gradients' in the walls, rust spots etc...
: those would be extremely smooth in 24bit). Maybe the Jag can't really keep up
: with full-speed 24bit high-rez, or maybe they just didn't bother in AvP.

More likely, it's a case of TV's having difficulty handling that
kind of resolution. Most Jag owners don't have monitors and TV's (as we
all know) run into problems when the resolution passes 320 X 200.

Message-ID: <EKZSAFUQUp@stingray.manawatu.gen.nz>
Source record: 176052

Hi - is there some1 out there who could ftp a file to a.a.u.e. for me?
Their Bart server thing doesn't seem to have a "receive" command.

The file is for the people who asked about figlet with the option to save
so I did a quick modification to the original code and recompiled with
a new -o <filename> option, to output the text to a file.

If any1 can ftp this (after I e-mail it to them) I would appreciate it...

Thanx,
Richard.

I have recently downloaded the shareware spreadsheet program OPUS, and found it to be very powerful and useful. However, only registered users are able to save and load Lotus compatible files. I would like to register and gain this capability, however, as far as I can tell, the author of the program, Doug Harrison, is no longer around (at least at the email address provided with the program) thus I cannot register. Does anybody know how to reach him? Does he still support his software? If not, would it be possible / legal for someone to upload a non-crippled copy to Merit or Hensa? Thanks in advance for your help.

> which I won't mention because it's a pirate copy. Look if it works under
> MiNT 1.12 I'll buy a legit. copy, OK?)

My guess is that your last version of MiNT was 1.04!! I had the same problem
for a long time, before I found out that MiNT versions 1.08+ first looks for
a directory called MINT (or MULTITOS! Both are valid!!) on your boot
partition.

You can use any one of the following solutions:

(a) move your *.XFS *.XDD *.XIF to the MINT (or MULTITOS) dir.
(b) rename your MINT (or MULTITOS) dir
(c) move your MINT (or MULTITOS) dir to another partition (but don't forget
to edit the *.CNF files properly

My suggestion is alternative a, since that removes some of the loads of files
that usually occupies the root dir.

That's all folks!!

Stefan

3885. Re: Splitting files for floppy

Source record: 176057

(Arnt Broska) writes:
>
> Or is there any archiver around, which can split the archive in several
> parts for floppy-disks at it self?

There is a program on a.a.u.e called "splitit" which will split and join files. It should really be trivial to code one yourself if you know a bit of programming.

I wrote an archiver about 2 years ago which supported multi-volume archives just like ARJ. Unfortunately, the compression is not as good (nor fast) as ZIP, ZOO, or LZH since I only implemented a simple LZ77 encoder (I didn't add the 2nd Huffman step.) But hell, it compresses better than ARC.

I was going to improve it, but then I found employment and never looked at it again. I always wanted to take the original AR002 source code from ZOO and LZH and "hack it" into my code so that it could support multi-volume archives.

The program is MiNT friendly since it is a TTP program compiled under Sozobon C. If you want to try it, just send me E-mail. Of course, I can't guarantee it to be bug free, but I've used it extensively without data corruption problems and trust my data to it.

One of these days when I clean it up properly and add a user-friendly GEM shell I'll post it to comp.{binaries,sources}.atari.st.

3897. Re: Demon access fot the ST (512k)

Newsgroup: comp.sys.atari.st
Date: 1994-11-25 11:14:01 UTC
From: mnb20@cam.ac.uk
Message-ID: <mnb20.112.000B3C1D@cam.ac.uk>
Source record: 176066

In article <3b1jot$93q$1@usenet.pa.dec.com> bouronm@trout.ime.dec.com (Marc CR Bouron) writes:
>How does CIX pricing compare with Demon? I understand that Demon charges
>are 10 GBP + VAT per month, plus your (local) phone call charge.

CiX has a one of setup charge, no monthly charges, but charges for online time (4p/min)

> What facilities does it offer, particularly in terms of Internet
> connectivity?

Demon provides an IP connection, so you can do anything you would from a full internet site. I'm not sure whether they also offer terminal based internet access. CiX provides terminal based internet access and it's own services.

3898. GCC compiler for DSP

Newsgroup: comp.sys.atari.st
Date: 1994-11-25 11:27:22 UTC
From: Szymon Stasik <stasik@bull.mimuw.edu.pl>
Message-ID: <Pine.BUL.3.90.941125121827.20365A-100000@bull.mimuw.edu.pl>
Source record: 176089

In one of famous Atari ftp sites I found sources of old gnu c (v 1.xx) compiler configured to give DSP code. It can be compiled on many systems, but of course not on Falcon. I was trying to configure it for Atari, but it doesn't give good results. I wonder if someone tried to compile this GCC, and can help me with this problem.

3899. Re: Shareware or not Shareware

Newsgroup: comp.sys.atari.st
Date: 1994-11-25 11:33:48 UTC
From: diehl@bonk.io.org
Message-ID: <3b4i2s$fcl@ionews.io.org>
Source record: 176018

Craig Graham (Craig.Graham@ncl.ac.uk) wrote:

: And in fact, some of the best software ever released on the Atari is shareware.
: Look at Kandinsky, ST-GUIDE, GEMVIEW (only surpassed by one progam I've ever
: seen - xv on the HP apollo700), CLA :) , OPUS (sadly no longer supported,
: but still a good spreadsheet), and many more...

Indeed, I've gotten many, many wonderful Shareware programs all of at least
competent if not superb quality. A lot of games, some great utilities, that
sort of thing. In fact, I could say with certainty that I find moe useful
or fun things in the Shareware/PD market than I do in the commercial market.
That's one reason I supporty it and develop for it; it's a viable market,
and it's also a great and easier way to find out what sort of response you
ghet to your programs.

: Amen. Recieving the registration fee is wonderful, not because of the money,
: but because it lets you know that people have appreciated your work and
: think enough of it to send you the cash. Even recieving a letter or two
: is good, and can spur you on to make things better.

Indeed, any response at all is great, though I would never turn down a
monetary registration, with money being as tight as it is at the moment.
Still, just to know that people are using my software is gratifying.

: And of course, I for one, always ensure that my registered users get
: updates way before the rest of the world (in fact they are the only
: ones who have the more recent versions of my stuff).

Indeed, your supporters are the most important, since they paid for your
program and are therefore serious about it, or at least enjoy it enough to
support it.

: My favourite thing along those lines was when a guy from Canada wrote
: to me telling me how his kids really enjoyed playing a game I wrote
: (not a very good one, but it was the best I could do when I was 14).
: I'd forgotten all about it, but that letter left me wandering around
: with a grin on my face for days......

True; I had a similar thing happen to me; I'd written a character editor and
"survival kit" for Silmarils' game Ishar: legend of the Fortress. It didn't
get any response, not that I expected it to, until one summer afternoon I
get a letter from some folks who found it extremely useful and helpful to
them, for they were stuck in the game with seemingly no way out, until
they'd gotten my program.

: And no, I haven't made a fortune either - maybe the PC version of CLA3
: will make more than the ST one did (don't worry, not abbandoning Atari,

: just expanding my market a bit).

No harm in that. I'm sure if I was able to do so I would, too. Though my first love and loyalty has always been to Atari.

Mosaic is an x-windows program. If you are running an X server you first type
set DISPLAY=your-ip-address,1
if you're telnetting in, I don't know what you set it to from a dialup
connection, probably the device name. But I don't know of an X server for the
atari anyway. If you can get your host to provide a slip connection you can
run programs locally on your atari using mintnet, although no-one has yet
ported a graphical web browser. There is a port of lynx, a text based web
browser (which you can probably use on your unix system anyway by just typing
lynx).

>or does it meen that the UK office did close...???

Atari UK as a separate entity no longer exists. There is now an Atari Europe that just happens to have it's head office where Atari UK's were. They also have a distribution centre in the netherlands, and have closed their other European offices.

Yeah, I got that one. I liked it alot... other than being in such a small
screen, but i can understand the difficulties in the full screen size.
I did have a problem with the ttp program though... I , however, did not
fiddle with it much :)

I remember seeing a post a while ago that although Doug Harrison is happy
to cash registration cheques, he no longer sends out the registered user
versions......and that gets us all a bad name.

In light of that report, I have no compunction about saying that at least
one of the major ST ftp servers has the registered version on it.
Scout around.....the improvements are minor though.

Craig.

>performance. Not that it matters, since you're screwed if you run
>DOS/Windows anyway...

Except, of course, that the f/p maths on the Pentium (specifically long f/p division) is broken - Intel have finally admitted to it so I can say this without fear of a lawsuit :) I say to stick with what you've got if it works for you - after all, there are no major bugs (AFAIK) in the 68030+FPU combo and while it's not earth-shatteringly fast, it'll get you there.

And after all, if you want real power, try an Alpha - now when are we going to get one of these on a processor card <g>

Cheers

: please say so, I am really interested.
:
: So at least there's _something_ a Falcon can do much better than the
: competition ;-)
:

This is quite amusing, since I have gone through this exact process recently. I wanted to move on to Digital recording, and priced Mac vs. PC vs. Falcon. I concluded that the Falcon could be fully equipped for recording for much less money than would be possible on another system.

Falcon $1000
2.1 Gig Hard Drive $1000
Falcon Digital Interface$ 500
14meg Ram Upgrade $ 600
14" Paper White Monitor $ 100
Logic or Cubase Audio $ 600

3800

How much would it cost on the other systems?

Atari Web Pages Latest News
~~~~~ ~~~ ~~~~~ ~~~~~~ ~~~~

Version 1.0
~~~~~~~ ~~~

Date 22/11/92
~~~~ ~~~~~~~~

by

Mark Stephen Smith
~~~~ ~~~~~~~ ~~~~~

================================================================================

Foreword
~~~~~~~~

Hello and welcome to the first news item on the Atari Web pages. This document
will describe the Atari Web pages as provided by Mark Stephen Smith and will
inlcude a list of the latest updates for the month. Each month I hope to update
this text with the very latest additions and news on the Atari Web pages.

Hopefully these pages will provide an invaluable service to their users, but
they are still at an early stage and developing all the time. As such any
feedback and support you may have for these pages is more than welcome, it is
infact encouraged. The more input I get from its users the better, as then I
will know what is good and bad about these pages and can change them
approproately in the hope of increasing their value to their readers.

Now on with the show.

================================================================================

What are the Atari Web pages?
~~~~ ~~~ ~~~ ~~~~~ ~~~ ~~~~~

These are a collection of pages covering all formats of the Atari. In these
pages may be found the latest news, reviews, software for downloading, and
various other information and links to other places of interest to Atari users.

I have tried to make the structure of these pages easy to follow and as
intuitive as possible but there is still a lot of work to be done yet.

================================================================================

How do I access them and what is the Web?
~~~ ~~ ~ ~~~~~~ ~~~~ ~~~ ~~~~ ~~ ~~~ ~~~
```

First of all I shall look at what the Web is or to use its full name the World Wide Web. The Web is new way of accessing the Internet, unlike previous methods where you were required to enter commands into the program you were using the Web uses a more user driven method of getting around the Internet. This method is much more graphical than former methods and as such is much easier to get to grips with.

When using a Web browser (the name given to a program used to access Web pages) the control method usually consists of a point and click operation. A Web page will consist of text and graphics which are sometimes highlighted in some way to indicate that they are selectable and link to more information or a particular piece of data.

Such a link is reffered to as a hyperlink. In fact the whole system is a variation on hypertext and uses a script to create each page. Each script is written to a HTML (HyperText Markup Language) standard which contains the main body of text in the page and a few command tags for the browser as to how to format the page and what to do with links, etc.

Web pages may contain text, graphics, sounds, and animations, although the later two are normally supported through external software. It is also possible using the Web to gain access to newsgroups, ftp sites, and gopher services all through the one program. As such this makes this a very powerful tool for Internet access, and coupled with its ease of use this has suddenly became the big thing in the recent Internet explosion into the media.

Browsers can handle all properly written HTML scripts but may vary in operation when scripts are incorrect or contain mistakes. Browsers can be divided into to distinct types, graphical and text only. Popular graphical browsers include NCSA's Mosaic and the recent new browser NetScape. On the text side Lynx is the most popular textual browser (NOTE: text browsers don't show any form of graphics).

To access the Web you must either use one of the above mentioned browsers on a machine such as a Sun, PC or Mactintosh, or if you want to access it via your Atari you will need a copy of the Lynx browser as unfortunately there aren't any graphical browsers YET for the Atari.

Next month I will give full details on how to access the Web using the Atari.

==========

Where do I find the Atari Web page?
~~~~~ ~~ ~ ~~~~ ~~~ ~~~~~ ~~~ ~~~~

From your Web browser choose to open URL and enter the following address:

http://www.dl.ac.uk/MISC/ATARI/atari.html

If you can store a hotlist of addresses or something similar on your browser then it may be worth including this address for quick access in the future.

Once you've done that you should see my main page so I hope you enjoy it, and don't forget to write with your thoughts.
~~~~~

==========

What you will find in the Web pages every month.
~~~~ ~~~ ~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~ ~~~~~ ~~~~~

From the main menu you have several links available to you, some under miscellaneous and others specific to a particular machine, or collection of machines. First I will look at what will be in the Miscellaneous section.

****

Atari Related links, Documents, FAQ's and Newsletters
~~~~~ ~~~~~~~ ~~~~~ ~~~~~~~~~ ~~~~~ ~~~ ~~~~~~~~~~

First in the list are "Atari Related Links", these links are to other sources of Atari information or data (such as files, etc.).

There is a link to many of the major Atari holding FTP sites on the Internet. Links to several Web pages by different people on the Atari. This will grow as worthwhile sites come up. At the moment you can visit:

- HENSA to download Atari files (Moderated by Denesh Bhabuta)
- ZFC's Atari Pages by Annius V. Groenink. This has links to various Atari related places, along with talk of his own work on Edith and his new Drive U Project. Annius is also working on a version of the Mosaic browser for the Atari and the best of luck goes to him on that.
- Christer Gustavsson's Atari Gem Programmers Page. Very useful information for programmers grapling with Gem and the operating system. Also offers help via his questions answers page. Some links can be found to Atari related places.
- CAIN Atari Pages. CAIN is the Central Atari Information Network and they create a newsletter which is updately monthly on all things new to do with the Atari. There are also links available here.
- Martin Maisey's Atari Pages. Contains information (downloadable) on programs written by himself for the Atari. Again there are links to other Atari places.

This section has one or two more candidates for the near future when more work has been done on the owners pages.

Documents
~~~~~~~~~

Useful documents will appear in here. At the moment there is:

- Atari FTP List by Hallvard Tangeraas (essential for the latest news on who provides Atari FTP sites). This is updated in theses pages almost as soon as Hallvard changes it.
- Atari TOS Desktop Survival Kit by Thomas J Hopper. An essential guide to getting the most out of your DESKTOP.INF and NEWSDESK.INF files.
- Recommended list of software for the Atari by Denesh Bhabuta. List compiled by Denesh for me of his best software for the Atari (updates coming soon). Mostly PD and Shareware, this list contains links to download most of the software mentioned.
- Information on picture formats by Dave Bagget. Lots of information on the format of different picture files for the Atari.
~~~~~~~~~

FAQ's (Frequently Asked Questions)
~~~~~ ~~~~~~~~~~ ~~~~~ ~~~~~~~~~

Useful FAQ's will appear here. At the moment there is:

- Atari ST SLIP FAQ. This is a guide to connecting your Atari to a network. All you want to know about networks and the Atari.
- Atari CD FAQ. Information on getting and using CD's on the Atari. Regular updates to this can be found in my pages.
- GDOS FAQ by Gerd Castan. Got a question on GDOS then this is the place to look.

Newsletters
~~~~~~~~~~~

Although there may be more to come the following newsletters are updated promptly as I receive them:

- CAIN Newsletter containing the latest Atari news.
- HENSA Newsletter containing the latest updates to the HENSA Atari archive.

****

Questions and Answers
~~~~~~~~~ ~~~ ~~~~~~~

Submit your questions to here and get them included in this page. Answers are open to anyone who has something valid to say, and help is provided to me on Programming and Music questions by several knowledgeable sources. Please support this section, only by your interaction and questions will it survive. All answers are included in this page for anyone else with the same question and answers are also sent back to the person who submitted the question for those without Web access.

If you feel you have an expertise in a particular area concerning the Atari and would be willing to answer questions on that area when and if I submitted them to you, then please let me know and you can join the team. Programming and Music are fairly well covered and I can cover Graphics programs, help with Technical questions would be appreciated.

****

Reviews
~~~~~~~

Here I hope to include reviews of Atari products both new an old. So far I have the following reviews:

- Kobold review by Andy Curtis (ST Format)
- Flash 2 review by Frank Charlton (ST Format)

There are several reviews on the way by the above mentioned people aswell as some by myself (waiting to get hold of Apex Media for the Falcon). This section should hopefully include around ten or more reviews by Christmas.

Again if you feel you would like to submit reviews for inclusion then please write to me. Please note these pages don't include Lynx and Jaguar Reviews, as they are contained within their own pages.

****

Updates and Information on these Web Pages
~~~~~~~ ~~~ ~~~~~~~~~~ ~~ ~~~~~ ~~~ ~~~~~

All updates and news on the Atari Web pages goes in here. Previews of whats to come soon are included and new items or updates to the pages are listed according to date with the most recent being first. Most updates contain links to the new material for instant access.

Other things to be found in here are the number of accesses to the Atari pages. At the moment this is out of date, but I hope soon to have this updated on either a monthly or even weekly basis.

****

This now concludes the Miscellaneous section. Now onto the Other Pages. These pages are specific to a particular machine, or collection of machines. These are going to go through some major changes and you can expect a fair number of changes to be made to these in the next month or so.

****

Falcon Page
~~~~~~ ~~~~

This will contain information and files relevant to the Atari Falcon, currently this page is divided into the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

In here expect to see any news or previews that come my way, whether they be small descriptions or full features with pictures. At the moment there is:

- Apex News. This contains some information I got on Apex Media for the Falcon when I spoke to Douglas Little on the phone a few weeks back. Not very detailed unfortunately, but I'm waiting on my copy of Apex to give a full review so expect that to be rectified soon.
- Dextrous News. Small description of some of the features of Dextrous with a picture. Only at an early stage of development, if I hear more it will go in here.
- Towers II : Plight of the Stargazer. Pictures and description of this great looking Falcon only sequel to Towers. Expect the demo soon.
- Newsletters from HENSA on Falcon section of archive.

Misc
~~~~

Miscellaneous information on the Falcon, including:

- Falcon Demo FAQ. List of Demos for the Falcon, including some form of information on each.
- Compatibility list of games with Falcon.
- Compatibility list of applications with Falcon.

New Software
~~~ ~~~~~~~~

The latest Falcon/enhanced software available for download. Major revisions to be done with updates here. At the moment the following software is included, with more to come:

- Play MPEG v0.68 by M.D.Griffths (shareware)
- Speed of Light v3.5 (shareware picture viewer)
- FOG issue 6 diskmagazine for Falcon
- Scape a planetary landsacpe generator.
- Digital Tracker demo of commercial version.
- Obsession 1 level demo.

Other software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth using on the Falcon.

- Backward v2.52. For compatibility with the ST. Please send any versions which are newer than this.
- MultiBlow. Configurable overscan utility.
- Starball. Excellent pinball game (Falcon enhanced).
- Berzerk. Excellent version of Berzerk (Faster on Falcon).

****

Atari ST/STE/TT/Mega STE Page
~~~~~ ~~~~~~~~~~~~~~~~~ ~~~~

This will contain information and files relevant to all the above mentioned Atari formats, currently this page is divided into the following areas:

News
~~~~

In here expect to see any news or previews that come my way, whether they are small descriptions or full features with pictures. At the moment there is:

- Newsletters from HENSA on TOS section of archive.

New Software
~~~ ~~~~~~~~

The latest (most recent versions) software available for download. Major revisions to be done with updates. At the moment the following software is included, with lots more to come:

- Speed of Light v3.5 (shareware picture viewer).
- ST Zip v2.6. Latest version of ST Zip.
- Obsession demo. 1 level of this great pinball game.
~~~

Other Software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth having on the Atari.

- Ozone. Good platform/puzzler.
- Starball. Excellent pinball game.
- Berzerk. Excellent version of Berzerk.

****

Lynx Page
~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News
~~~~

News on the Lynx and related material. At the moment there is:

- Lynx Summer Steal Deal Extended to the Fall. News of price reductions for a limited period.

Reviews
~~~~~~~

Reviews for just about every Lynx game ever released will appear in here. All reviews are by Robert Jung. At the moment the following reviews are included:

APB Awesome Golf Baseball Heroes
Batman Returns Basket Brawl Bill and Ted's
BlockOut BattleWheels Blue Lightning
California Games Checkered Flag Chip's Challenge
Crystal Mines II Dino Olympics Dirty Larry:Renegade Cop
Dracula the Undead Double Dragon Desert Strike
Electro Cop European Soccer Chal. Ultimate Chess Chal.
Gauntlet:3rd Encounter Gordo 106 Hard Driven'
Hockey Hydra Ishido : Way of Stones
Jimmy Conners' Tennis Joust

Other Lynx Stuff
~~~~~ ~~~~ ~~~~~

Other items of interest to Lynx owners. At the moment there is the following:

- Lynx FAQ

New Software Anouncement
~~~ ~~~~~~~~ ~~~~~~~~~~~

Currently holds news of Bouble Trouble and Super Off-Road for the Lynx. Expect reviews soon.

****

Jaguar Page
~~~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

All the latest news and preview information I can find related to the Jaguar. Although empty at the moment expect this to fill up very soon (lots to come).

Reviews
~~~~~~~

A collection of reviews from different sources, hopefully I will be contributing more to this section myself. Reviews so far include:

Aliens versus Predator Raiden Tempest 2000
Cybermorph

There are many more reviews to come.

Other Jaguar Stuff
~~~~~ ~~~~~~ ~~~~~

Miscellaneous information on the Jaguar. Information included presently is:

- Jaguar FAQ
- Raiden Tips
- Jaguar Game Cheats
- Kasumi Ninja FAQ
- Ultra Vortex FAQ

Other Jaguar Pages
~~~~~ ~~~~~~ ~~~~~

Other pages specific to the Jaguar included in here. Currently there is:

- Atari Jaguar Homepage by Nils Jacobsen

There are others that will be included, some containing more recent news, but the one above is the most organised and intuitive one I've came across.

****

8 Bit Atari Page by Ivo van Poorten
~ ~~~ ~~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~~~

Not maintained by me these pages cover the 8 bit formats of Atari machines and are very comprehensive. Nearly everything you could hope to find is contained within these pages.

****

What to expect in the future
~~~~ ~~ ~~~~~~ ~~ ~~~ ~~~~~~

Some structural changes are likely to appear in the next months. I will be introducing an announcements page where you can tell the World of anything you have to announce. Please send news of updates to your programs, Atari stuff for sale, and any other Atari announcements here (NOTE : Commercial companies should send information on products to be included in here and in the news sections).

Also coming soon will be a monthly editorial. In this I will try and sum up the month past and to give my opinions on how I saw things for Atari at that time. Hopefully I will be able to look back over many good developments in my pages and summarise them as they happened.

There is an outside possibility of starting a programmers and MIDI section in these pages but this is as yet undecided. I will judge whether or not to do this based on the kind of response I have. I do not want to repeat any of the good work done in these fields however by other Web page writers such as Christer Gustavsson.

More support is needed for the questions and answers pages, although initially successfull people just stopped posting their questions. Although the odd one is still coming and answers are still forthcoming. Please support this, it is of benefit to anyone who uses it.

The Jaguar section should have a lot more news, pictures and reviews in the future. I now own a Jaguar and will soon be writing a review for Aliens vs Predator. I have tracked down a fair bit of news and am in contact with a few companies now and hope to get news from them on there products.

Extra pictures will appear due to my recent access to a colour scanner, enabling me to scan the latest pictures before the exist elsewhere on the Internet. I also hope to slowly get all the maps for AvP into these pages somehow?

Both the ST and Falcon sections should contain much more news in the future, along with more of the best PD/Shareware, and PD/Shareware reviews. I should have several demos hopefully in the near future for games coming out on these formats.

The Lynx section is to continue to get reviews and I will update the news as and when I get it.

Expect more links to Atari related pages in the future, aswell as links to all the Atari related newsgroups. There will be more newsletters, documents, updates to the FAQ's, I hope to include AEO soon also.

Expect further reviews from Andy and Frank, along with myself (watch out for the Apex Media review). Hopefully I can include more screenshots, and do a few program tutorials.

Last but not least, after Christmas I may set up a feedback page, where you can send your feedback via a Web form. Until then please write with your ideas, critisms, comments, submissions (software, news, reviews, questions, etc), to me and don't forget that I am now the official maintainer of the Atari FTP list originally by Hallvard Tangeraas. All updates to this list should now be sent to me.

Thank you and see you with the updates to these pages next month!

3916. Gemini2

Newsgroup: comp.sys.atari.st
Date: 1994-11-25 14:23:38 UTC
From: rbets@edx.ed.dreo.dnd.ca
Message-ID: <3b4s1a$l70@nouvelles.dreo.dnd.ca>
Source record: 176088

I have recently acquired Gemini2 and I have to say that I'm impressed.

Is there an english version or resource files in english available?

Also, I have just started using a STe w. TOS 1.06 and the version of
Startgem won't work. Is there a program that will load GEM apps at
bootup on an STe?

Thanks.

P.S. Please email responses to me directly in order to avoid clutter
in this group.

Cross-posted to: misc.forsale,ca.forsale,fidonet.for-sale,comp.sys.atari.st

I have the following Atari ST programs for sale. They are all
original disks but, with exceptions noted, are parted from
their documentation (who reads it anyway?).

I pay postage at the prices shown to anywhere in the US.

The Black Cauldron: Sierra Software, Walt Disney, on 2 disks. $11.

Falcon: Spectrum Holobyte, on 4 disks, $15.

King's Quest: Sierra Software, 2 disks plus a 360 page book
"King's Quest Companion," all for $16.50 (The book by itself is cover
priced at $14.95)

King's Quest II: Sierra Software, 2 disks $11.

High Roller: Mindscape, 2 disks, $11.

Typing Tutor Word Invaders: Academy Software $7.50

--------the following programs are each on a single disk----

Dungeon Master: FTL Games, one disk and a 69 page book,
"Secrets of Dungeon Master" $10.

STWars: Miles Computing $7.50

Outrun: Sega $7.50

Major Motion, The Atari ST Arcade Adventure Program: Michtron
7.50

Hades Nebula: Gamebusters (requires color monitor) $7.50

Airball: Microdeal $7.50

Super Cycle: Epyx 7.50

MadLibs, World's Greatest Party Game: Price/Stern/Sloan $7.50

ALSO

PrintMaster Plus: Kyocera Unison Inc. $13.

% PC: Unix.)
%
He said 68060. Not 040. The 060 will eat a dx66 for breakfast. You're talking
> Pentium-60 speed here.

Now I only know of 2 060 machines, both are still under development, a
both
are atari clones. I also know of someone in the Linux-68k camp who is
going to port Linux-68k to the 060 next week or so, and was asking about X11
servers for the Atari range.
Once we have 060/X11 You have a machine faster than my DECstation 5000/133
here in KCL. Not bad really.

Why oh why are we only *now* seeing the sort of Atari machines I've be&#65533;0
for years!

3924. STFM: Connecting HD drive & reading DS DD floppy disks

Newsgroup: comp.sys.atari.st
Date: 1994-11-25 17:58:33 UTC
From: rjt2@bnr.co.uk
Message-ID: <3b58k9INNsqt@bhars12c.bnr.co.uk>
Source record: 176095

I'm looking to upgrade the internal Single Sided disk drive in my 520ST-FM.
DS DD (720K) disk drives seem to be going for about 40 pounds sterling in the
UK, but with HD (1.44M) drives going for about 10 pounds more, I was hoping it
might be possible to connect one of these instead.

Can anyone advise me on the following:

1. Can the ST floppy drive controller cope with HD disk drives?

2. Would I be able to write data in HD format from commercial software,
e.g. Cubase ? (I would be happy to format disks with special software)

RS Components supply a Panasonic drive which "is able to operate in both
normal (1Mb unformatted) and high density (2Mb unformatted) modes"

3. Would a drive like this allow me to read DS DD or SS DD disks (even if
only through special software) ?

4. If "yes, yes & yes" does anyone know of suitable software?

Any advice gratefully received.. and any suggestions of cheap UK sources for
replacement drives are welcome.

Regards,

Richard

The CDAR 504 _has_ _been_ released. In Germany at least. It shipped with a Public Domain CD (ST Computer series 1-270(!)). An ex-student at the univ. of Passau bought one in 1991 or 1992 for 100 DMs (50 US$ then) when a local dealer threw out all their Atari stock (now they have gone bankrupt :-)).

] Also, I have just started using a STe w. TOS 1.06 and the version of
] Startgem won't work. Is there a program that will load GEM apps at
] bootup on an STe?

Yep, it's called the OS :).

Click on the program to autorun, then "Install Application" from the "Options" menu. Click on the "AUTO" button, select OK and then save the DESKTOP.INF file. When you reboot, it automatically runs the program in a similar fashion to StartGEM. AFAIK there's no key combination to hold down to abort the process, which can be a nuisance.

%
% I know not enough about Pentium and 68000 internals to discuss
% those terms. However, I'll take a broader perspective. Are you saying
% that the (circa 1979) 68000 is superior? Faster? More advantageous??
% - Than a 64-bit Pentium? Are you prepared to go public with this
% discovery? I do not know whether what you say is true about "more 32
% bit registers" inside your 8Mhz 68000 over a Pentium, but I'll put my
% money on the Pentium to whip the stuffing out of a 68000, regardless of
% how many registers it has. Perhaps it is on that fact you should focus.

Because it's also a lot newer, not because of any intrinsic wonderful
architecture. The fact that it runs at over 10x the speed helps too.

% How does your 8Mhz 68000 crank out those ray traces? Probably
% on par with a Pentium. I'm sure you can leave my DX2/66 in the dust
% the floating-point capability of the 486 sucks the big one.

It's interesting to see that a plain vanilla ST (8MHz 68k) under GNU '^
perform on a par with a 25MHz 386 when running raytracing apps.
This is an application measurement from the output of POVray. POV times
itself, so you get an accurate measurement of total time.

[deletia]

I'd be willing to put money down that the 68060-based atari clones
will
outperform the Pentium-60. I'm not going to claim they'll beat the P90's,
but that's a matter of clockspeed. The 060 runs at 60MHz I believe.

Followups have been directed to .advocacy

> Is this possible?

With the commercial version you can - it takes over any copying procedure.
(What do you mean by COMPLETELY replace the copying functions?)
It will copy even one file - although then it actually slows down copying as
it has to load itself in - see DESK_KBLD (I think that's what it's
called).

Its all relative.

CBZONE is hardly the best game around, although those people who have suitable hardware (TT or Falcon with FPU) and who have tried it - have generally been impressed.

Also I don't know of any other Battlezone clone in the PD?

:-)

Roland.

] the data being transfered MAC<==>modem.

Just make sure you use a proper RS232 cable is used (not a mac
DIN-plug one), on the ST, and they will usually work perfectly
well, although often not the other way around due to Mac's handling
flow control in a strange manner. Often the &R command will have
to be toggled. (&R1 on the Mac', and &R0 on everything else). I was
using a "mac" modem on my ST for well over a month. (A 28800 baud
one at that!), and all I had to do was wire up a NZ compliant
phone cable, find a 9V-AC PSU, and plug in the RS232 cable from
an old 2400, and away it went...

3944. Need help w/ old game "STARGLIDER"

Newsgroup: comp.sys.atari.st
Date: 1994-11-26 05:06:37 UTC
From: wunner@nova.tat.physik.uni-tuebingen.de
Message-ID: <wunner.785826397@nova>
Source record: 176029

I just dug up my good ol' Atari ST with a couple of games...had a pretty good time! :-) I especially like StarGlider from ArgonautSoftware/Rainbird!
My question is, can anyone give me a few hints/tips for that game? I managed to battle my way to level 7 or 8, but I don't understand if the game's whole objective is to destroy as many enemies as possible, or if there's more to it (like kill that big baddass, Hermann Kruud or something). I tried to find the manual to no avail, but from what I can remember, there weren't all that many hints included, anyway...I think there was only stuff about the game's plot, like our hero entering the AGAV, things like that.
Also, can anyone tell me if those little "bridges" which can be found on every level are of any use? They don't shoot lasers/rockets at me and I can't seem to destroy them. I think there are two types of those "bridges", and they look something like this... __________
| /\ |
|__/ __|

Any hints on this game appreciated. I'll post a summary of all hints I get from you if there is the demand. :-)
Later,
Lukas.

Ok... since all you guys have been so helpfull in the LCP commands, please tell me what I'm doing wrong...

I'll start the game, (enter the stuff into the book, name/date) the game will start with my little computer person coming onscreen and banging constantly on my monitor screen... I'll try communication (all the please xxx xxxx xxxx's) but he'll keep banging. Assuming he's hungry or something I order him some food - the doorbell will ring and he'll stop knocking, and start looking at me, looking at the door, smile, look at the door (he's standing upstairs looking at the typewriter too).

I'll ask "please type me a letter" or "please open the door" but he won't, arrrgh!!! whatsup? anyone know - do i have to do something first to get into all this cool interaction?

Man, this game is so cool - or appears to be if i could get into it <g>

Thanks in advance! :)

Andy (Little Dumb Person)

Well for graphics theres also D2M which is now at 1.5
and a sound tracker called Digital tracker, a game called
Moonspeeder is about to be released in France too
As for brainstorm's product you have the Jpeg DSP
decode routine available at several ftp sites, you
also have the Assemble/Adebug package : its an Assembler for
all the 68k familly which really is _FAST_
and a powerfull low-level debuger. I use them and am pleased with them
they are ugraded frequently on brainstorm's BBS.

Computers are the religions of the '90s!

I firmly believe that NEXTSTEP is the best operating system available
for PCs. Linux is pretty good, and OS/2 is usable, though it's full of
stupid DOS-esque design flaws. Naturally, the most common things, like
DOS/Windows, are _terrible_.

PC hardware is pretty losing; it'd be really, really nice if someone
would design a "clean" PC for use with the Pentium... PCI only, no ISA,
SCSI on the motherboard, etc. You know, like the PowerPC's PREP/CHRP,
but for Intel processors. It'd probably be cheaper than IBM's (and
Motorola's) PREP offerings... Not that I'd want to buy an Intel CPU
(hey, who needs registers these days!)...

With the advent of MultiTOS, MiNT is Now TOS. Atari licenced it from
Eric Smith, and even hired him on to work there (though he's "only"
doing Jaguar stuff these days).

3955. GHOSTLINK--STe>DOS

Newsgroup: comp.sys.atari.st
Date: 1994-11-26 16:57:25 UTC
From: rrice@netnews.upenn.edu
Message-ID: <3b7pdl$8pd@netnews.upenn.edu>
Source record: 176027

To Whomever:

I just received a Belgian program called GHOSTLINK, which is supposed to allow an ST/STe/MSTe/Falcon to access a PC's hardrive partitions from the Atari TOS desktop over a null modem cable. I was hoping to use it with my Omnibook 300. The fastest I could get reliable directory readings was 4800 BPS over the null modem cable (with STalker/Procomm I've transferred files at 19,200), and I could NOT transfer larger files--the program would seem to hang up, or be working at a much slower rate than 4800 BPS. The program looked so promising... And it does allow TOS access to a disk, as long as you don't want to do anything, or so in my case. I have the HSMODEM drivers installed, and tried this on both my Modem 2 and Serial 2 ports on the Mega 4 STE. Input of any sort much appreciated.

>hand-written assembler. And even if you did, you would spend 3-4

Besides easier maintainability, C also has the feature of being easily
portable to newer processors. Assembly definitely doesn't have that
feature, unless the processor has major amounts of compatibility (like
68000->68030, 8088->80[12345]86)... even then, though, C would have the
advantage of _using_ the new processor's new features, where the
assembly code would probably be less than optimal on the new processor.

>Cool! The best code to write is the code you don't have to write. Every
>minute you are saved from writing something that isn't needed is a minute
>you can spend adding more features to your application (or spending more

This is one of the GREATEST things about C++, Smalltalk, Objective-C and
other object-oriented languages.

>Yes, but the windows system has VM available. The Atari doesn't (on Atari
>base models, yes I know there are third parties that do it) and some people
>might consider that important. On the Mac, you can turn off the VM, can you
>do this on Windows? I honestly don't know, I am not a big Windows user.

My experience has been that if you turn off VM in Windows (even if
you're got lots of physical memory) the system gets _really_ unstable.
If you thought Windows 3.1 was unstable most of the time, turn off
virtual memory for a good laugh. It's terrible.

One of the most annoying (IMHO) things about the Windows UI is that
stupid concept of "every app has its own desktop in a window". If you
minimize a document in Word, for example, it minimizes to the inside of
the Word main window, rather than to the Windows desktop. Now, given
the stupid way the Windows desktop is handled, I can see why it was done
like this, but that doesn't make it less stupid. Os/2 merely hides the
window (it's available from the Minimized Window Viewer or the Task
List), so your desktop doesn't get cluttered. Motif just dumps an icon
at the bottom of your screen, dunno about other X window managers (Motif
is pretty sick, but that's due to its CUA-'89 roots).

> ~Chris

Chris -

Before we get all hyper and degrading, let's examine some facts.

The computer market is one of the fastest paced markets in existence. You
don't just bow out for a while and expect anything to be left when you
return. People with far better products and marketing then Atari fail in
this market everyday. If Atari re-enters the computer market, they will be
starting from scratch. No matter how much you like TOS, it is not even close
to being an OS that competes in 1994(5). Today you need to be working
around the clock on your system software just to keep it competetive.
Atari has allowed their image to slide to the point where many stores don't
even want to carry the Jaguar, because Atari is known for shafting those
they do business with.

Sure, they could re-enter the computer market at some later point, but
don't be sitting by the phone. Most of the Atari developers have left,
or are working for other platforms primarily. It is a hostile enough
world when your product is compatible with something else, and downright
deadly when it isn't.

>Why? I don't think so. It _is_ true that we don't have direct equivalents to
>486- or Pentium PCs made by Atari. But these comparisons disturb me, since the
>OS isn't the same, either. Falcon under Windows would be pretty awful, I guess.

Huh? Why would you want to run Windoze on your Falcon? Or on anything,
for that matter?

>Just like those 386..486SX PCs. But TOS isn't Windows - fortunately. Falcon
>works quite happily even unaccelerated. With some Afterburner accelerator card
>(68040/66 MHz) it probably behaves like a dream.

How many times do we have to say this? Listen carefully: There is NO
SUCH THING as a 66Mhz 68040 chip.

>Falcon _is_ reality. We can buy it - and it is a good computer, no matter what
>some people think about it. TT is reality, too. Accelerated to 48 MHz and
>equipped with a good graphics card, like new Spectrum cards (up to 6 Mb VRAM
>and huge resolutions, accelerated ;-), that machine is worth its price.

No, it's not. To buy a "decent" TT setup, you need:

TT, 2M RAM 0 disk -> ~$1500 US
500M SCSI disk -> ~ 500 US
16M RAM SIMMs -> ~ 1280 US
RAM adapter card -> ~ 300 US
2M VRAM video card -> ~ 800 US
External SCSI CD-ROM -> ~ 600 US
17" Sony Trinitron -> ~ 900 US
Total -> ~$5880 US

Prices are higher in Canada. If you can find someone to sell you the TT
or the TT video card.

>And then there are Medusa T-40, T-60 (68060 !!!), and Eagle Atari clones
>available. So, can we really say there's "no hope" ? I really don't think so.

And where can you go to see any of these? Given the price, there's no
way I'd order one without using it first.

I'm pretty sure nobody in Canada even _owns_ one, unless it's DMC
Publishing. Certainly no "hobbyist" owns one.

>Our problem, however, seems to be this: we look at those PC technical specs
>(forgetting that Windoze _requires_ much more horsepower than TOS!), and feel
>that Atari is unusable old-fashioned, slow and so on. What matters is that the
>machine _works_. Atari compatible computers do work today. There are lots of
>fine programs available, and with OSs like Geneva, MiNT and MagiC (not

>forgetting Dextrous ;-), the future doesn't look bad either.

My 4M ST certainly doesn't _work_ for say, C++ development, or raytracing, and it barely works for simple UUCP networking. With MiNT going, it won't compile even simple C++ code because of the lack of RAM in my machine.

>Why should it be made by Atari? Are all the PCs made by IBM today? And can you
>_really_ say that Medusa T-60 with 68060 processor (yes, it _is_ reality!)

Where can I see one? How many thousands more than a similar Pentium system would it cost, without approaching Pentium performance?

>isn't fast enough for you ?? Somehow I doubt that ;-) Especially, after
>I saw Calamus running on both Medusa T-40 (68040) and on a 486-66 PC (under
>Windows NT). Guess, which one worked _much_ faster..?

We're not talking about NT. Warwick's running Linux on his PC; Linux is VERY VERY fast. NT is a major resource hog, and requires massive hardware just to prop up the operating system, let alone an application as well. And even then, you could run Calamus on a 300Mhz Alpha AXP system if you weren't satisfied with the speed of Calamus on NT.

>This is getting serious, if the PC world has really brain-washed us to measure
>Atari computers on PC scale, don't you agree? If this goes on, soon we'll all
>want a 786-PC because of its "raw power" - even though its OS and software
>don't necessarily run any faster than Atari TT.

If you buy a PC to run Windows because that's what everyone else has, you're an idiot. If you buy a PC to run Windows because you need to use particular software, you've made a good decision (though it'd be much, much more sensible to run OS/2).

Software should drive computer purchases. Linux 68k will never support the Medusa '040 or th4e '060-based system... nobody else is using the '060 for _anything_. You'd have to pay too much for too little power if you wanted to run Linux on an Atari system.

>Disagree, if you want to - but somehow I feel that _we_ Atari owners lack
>self-confidence. We don't have guts to be satisfied - we only complain...
>:-(

I'd definitely be satisfied with my ST if it had reasonable graphics for 1994, and a reasonable amount of RAM (enough to compile C++ code), and reasonable speed (enough to compile C++ code in less than a few minutes for a trivial object, and enough to render an image with POV-Ray in less than a few hours).

Unfortunately, there's no way to upgrade my ST to this level, and it's completely impractical from a cost perspective to even consider a TT or Falcon, due to the high cost of the required upgrades I'd need.

>By the way; when will the next (hopefully 68030-optimized ;-) NetHack be out ?
>I really can't wait for that -

Why wait, run it now. NetHack isn't processor-bound, so why wait for an
'030-optimized version?

>Don't surrender - fight back. Because otherwise all we'll have tomorrow will
>be Windoze-PCs. And, I think, most of us bought an Atari because we really
>_did NOT_ want to buy a PC. That's something to think about, no matter what
>kinds of 786-processors they develop. If we buy Atari-compatible machines like
>Medusa, we support Atari computing. Even if Atari itself didn't care...
>The PC world don't need IBM either, does it?

The Medusa is FAR TOO EXPENSIVE for, say, 99% of the Atari community.
VERY FEW will be sold, and even then it'll only be to people that
(basically) need a better platform to run Calamus SL on; that's
definitely not going to spur software development for the Atari
platform.

IBM hasn't been in control of the PC industry since before the TT made
it to market.

I certainly wouldn't buy a PC to run Windows, but I would consider it
for NEXTSTEP or Linux. I'd _prefer_ a RISC system (PowerPC, PA-RISC,
MIPS, Alpha AXP, I don't really have a favourite) but there's no way a
normal hobbyist like myself can afford one... workstation prices in
Canada are almost 2x what they are in the 'states.

> What do you consider "pathetic" disk performance? How many

Any system where the bus can't keep up with the disk is pathetic. IDE systems are another brand of brain-damage, where performance is dependant totally on CPU speed...

>people need file server data transfer rates for the machine sitting on
>their desktop??? "Most PCs" (as you put it) do not have the transfer

If you're running a system with virtual memory (ex, Windows, OS/2, some brand of UNIX) you'll want a system where:

1) disk->memory transfers can occur as fast as possible
2) disk->memory transfers don't halt the CPU (like they do on IDE)

>rates of a server, but what is the handicap in that there is no
>overkill? Anybody who wants to discuss this reasonably will concede to
>the fact that while most 16-bit IDE interfaces are not the fastest in the
>world, they are a far cry from "pathetic." I might consider an 8-bit MFM

What's the point of buying a fast CPU (ex, Penium, or '486) if it's going to spend a lot of time sitting there waiting for disk transfers to finish? IDE can't even _do_ DMA transfers; a massive waste of CPU time.

>interface "pathetic", but I find it totally outside the bounds of reason
>to state that "MOST" PCs are. It is relevant to mention that almost ALL
>new PCs have a 32-bit disk interface.

VLB-IDE is no better; your CPU is still pushing all the bits. It's "good enough" because you don't really have much of a choice, unless you're putting the system together yourself. I haven't seen a _single_ Pentium system advertised in BYTE with SCSI, they're all IDE.

> 486DX2/66Mhz, 8MB RAM, 256K cache, 420MB HD, VESA LB HD
>controller, VESA LB 1MB graphics card, 15" flat screen .28dp NI 1280x1024
>monitor, HD floppy, DOS/WINDOWS/MOUSE. $1237 pg. 10 Computer Shopper11/94

That's not a decent system. Well, OK, it's a usable system, but I wouldn't spend a dime on a system with IDE disks... I'm VERY fanatical about SCSI. And I wouldn't waste a dime on DOS or Windows or a serial mouse.

> This isn't 16MB of RAM or a 500MB hard drive (close) - but don't
>try and tell me that I can get a UNIX workstation for PC prices. Name

For the cost of an Indy (about $5k US) you can't possibly buy a PC with
the same features.

>seen 545MB IDE drives going for $258, so upgrading the 420MB drive would
>be minimal additional cost. RAM is appx. $40/meg so we're looking at
>another $400 to take 'er to 16MB.

And, gee, you've still got that IDE disk. Sure hope you don't want to
add a DAT and a CD-ROM... And then there's the other liability of
DOS/Windows. It may be fine for you, but it definitely isn't for me...
I can barely stand to use OS/2 at work.

> Anyone who fails to acknowledge the largest library of
>microcomputer software AVAILABLE ON THE EARTH must have their head
>somewhere where it shouldn't be. To fail to concede that ONE point about
>the PC.....just that ONE....makes a person so TOTALLY unreasonable that
>they should avoid discussion of computers altogether.

I _did_ concede it; BUT, it's of absolutely NO USE to _me_. I wouldn't
run DOS if I had a PC, I'd be using Linux or NEXTSTEP. _I_ know how
much of this "massive software base" is available for Linux and
NEXTSTEP, do _you_?

> There's the contradiction of the week, folks. However, I'd like
>to add that besides being faster with better displays, they have enormous

>hits of acid (unbeknownst to us, of course) and all the neat stuff you
>THINK you see is just an illusion. Right, Chris?

It's the same interface (DOS), the same bus and architecture (ISA), the
same stupid limitations (640k, 64k segments, "near" and "far" pointers
under C), the same crappy keyboards, etc.

You appear to have totally forgotten the difference between the 8-bit
and the 16-bit computing world (maybe you weren't around then).
That's the sort of thing I was talking about.

Uh, yah, whatever. Nothing else is sold up here (other than a few Macs, which are pretty hard to find). Some choice.

I don't know how you can call it bang-for-the-buck, either, really. Saw a bunch of Pentium/60 systems benchmarked in BYTE a couple of months ago... the systems ranged from ~45 SPECint to close to 60 SPECint, which is what Intel publishes for its reference system. Several of the systems had worse performance than '486dx2/66 systems! All thanks to all those cheap components and crappy de-facto standards (like ISA-bus and IDE disks).

Then there were all the systems that wouldn't run the benchmarks because they couldn't manage to get SCO UNIX running on the system...

That's got to be the stupidest thing I've read all day.

If PC Xformer runs under DOS, it's probably not 32-bit, unless it uses
some DOS extender (which causes a whole new range of interesting
problems... try running it under OS/2 or Windows NT).

The Pentium has just as many 32-bit registers as the '486, or '386,
which is about 2 more than the '286 and '186 had. With more registers
comes SPEED. Put 32 or 64 32-bit registers on the Pentium and you'll
have a REALLY REALLY fast chip, instead of a fast chip slightly crippled
by backwards compatibility.

Luckily for the PC industry, the Pentium is pretty fast, despite the
crippling it's received at the hands of Microsoft.

>*too* fussy about the spec.
>
>Whether its actually worth buying a TT at this late stage in its life is
>debatable - but that doesn't detract from the point that its still a very
>nice machine.

I really wish someone would post the component costs for a system like
this:

TT030, 2M ST-RAM, 16M TT-RAM, 500M disk, doublespeed CD-ROM, accelarated
video card capable of 1024x768x256-colours (but preferably
1152x900x256), decent 17" monitor.

It's too bad there's no '040 upgrade for a TT, and no upgrade path to
RISC. Not that it'd be worth it to go to RISC, everything would be
totally emulated (thanks to the dead Atari software industry... nobody
would rebuild any legacy applications).

If I were designing a "new" computer today, I'd want to design a sort of
Personal Workstation (though who'd want a "PW"? :)... maybe like this:

* MIPS R4x00 or PowerPC-603 CPU (both have excellent price/performance)
* Fast SCSI-II on the motherboard
* 4 72-pin SIMM slots (so you can upgrade 1 SIMM at a time)
* 21M Floptical drive
* at least 300M hard drive
* PS/2-style mouse and keyboard sockets (cheap mice, cheap keyboads, and
plenty of both to choose from)
* two serial ports capable of 115k baud
* one parallel port
* two PCI slots

* target price = ~$2000 with 300M disk and 8M RAM; available for less with no disk and no RAM, or for more with 1G disk and 32M RAM (that's only 2x16M SIMMs, so you could still add anoher 32M easily... more if there are 72-pin SIMMs larger than 16M)

What, you say, no floppy drive interface? GOOD. Floptical on the SCSI bus would provide us with backwards compatibility with old 720k/1.44M floppy media. Floptical would provide an excellent media for distributing new operating system upgrades (maybe have a .5M flash-ROM in the system) and large applications that aren't huge enough to merit CD-ROM distribution. Media's fairly cheap, though the drives are still expensive.

PCI slots are for video and Ethernet or whatever. A more expensive system could have another PCI slot, and maybe Ethernet on the motherboard.

Did I leave anything out? I have no idea what software I'd put on it... maybe FreeBSD or Linux. NEXTSTEP would be wonderful, but it'd cost as much as the hardware! I'm sure if we had the potential to sell lots of these, Windows NT could be ported (MS's story is that NT is easily portable to new systems, and it's already running on PowerPC and MIPS systems).

Yes, no ST backwards-compatibility, no DOS, no MacOS. Like I said, it's a home workstation. If there was an Atari software industry, we could provide a GEM-on-X type of library to allow easier porting of GEM applications to the new system.

Don't be a Solitary Atari.

Announcing the meeting place for all Atari Users.

This coming month the annual SWAP MEET for all Atari Users!
Bring your Atari items to this event, to sell or trade for the
hardware, software you have wanted, needed, or were just curious
about.

We only ask that you donate 10% of the selling price to the club.

Membership applications will also be availible at this meeting there
are three different levels to fityour budget, Economy, Regular, and
Exexcutive.

Best of all learn where you can STILL buy the latest in Atari
software, hardware, and upgrades.

Join the ranks of other 8-bit ST, Mega ST, STe, TT030, Falcon, Lynx,
and Jaguar owners.

At 7:30 pm on Wednesday, December 14th.

ATARI COMPUTER ENTHUSIASTS OF COLUMBUS
P.O.BOX 29103
COLUMBUS, OHIO 43229-0103

Meeting at the Chemical Abstracts Building
2540 Olentangy River Rd. 1/2 block north of Lane Ave.

Where did you get these prices?

In Germany this amounts to ~ 2000 DM + 600 DM + 1500 DM + 1000 DM + 600 DM = ~ $3600 US (where I'm not sure about the RAM prices).

Bry:

MultiTOS is more than a match for DOS or the mac system. If they had the money, Atari could, within 6 months, easily re-enter the computer market at any point and compete. Now, I don't mean 6 months from today, I mean 6 months form the time they decide to re-enter to the time they came out with the first new model. The ST itself was invented within 9 months or so. With what they have done and good financing (which they don't have) a 6 month lead time is plenty and they would absolutely be in-line with whatever is cutting edge on that day.

3980. 1st Word Plus bug?

Newsgroup: comp.sys.atari.st
Date: 1994-11-27 06:41:30 UTC
From: hellman@teleport.com
Message-ID: <3b99mq$62h@elaine.teleport.com>
Source record: 176050

Hello All,
I've continued to use 1st Word Plus in part because it is such a
rock solid program. One bug I've found (v 3.14 and up) occurs only when
you set the ruler to double spacing. Here's the bug:
Any style you apply (bold, underline, etc.) will turn off on the
screen when you tell it to. But when you go to print, the style stays on
until the end of the page. This does not happen all the time, but enough
to be a problem. It does not happen at all in single spacing.
Anyone else noticed this?
Walter

Gembench and Gemtest will use the blitter if it is switched on since both
of these programs do only make AES and VDI calls (AFAIK) to produce their
graphics output. You should easily see a difference between running Gembench
or Gemtest with blitter on or blitter off.

3983. Help with C programming

Newsgroup: comp.sys.atari.st
Date: 1994-11-27 09:46:48 UTC
From: leslieh@warpcon.ersys.edmonton.ab.ca
Message-ID: <EK2JDDUTUp@warpcon.ersys.edmonton.ab.ca>
Source record: 175978

Any replies will be appreciated. Please reply to me, as the
follow doing this doesn't have an internet account.

I'm building a flowcharting program using an object tree as a page
of the flowchart. The symbols are icons with children that are strings.
The lines are user-defined objects with no children. The parameter passed
to the routine to handle the user-defined object consists of a list of
objects to connect.

The first object is the orgin object. The rest of the list
contains the objects the first object is connected to. It also contains a
string that is the label for some of the lines (such as labeling a yes and
no branch in a decision).

The things that I need to know are:

- How to insert an object or objects into an object tree,
maintaining the rules for a GEM object tree (such as the
root object has to be the size of all the children,etc).
- The best way to delete an object in a tree.
- How to print an object tree keeping it compatible with
the majority of Ataris.
- How to save an object tree so that rsrc_load can
understand that it is a tree.
- Perhaps some fast drawing routines for symbols instead
of using icons for symbol representation.

Thanks in advance for anything you can give me,

Blaine Brysh

Thank you for any help you can give.

Leslie

Yo.
Could someone post complete Specs+description of the 68060?
Also, specs on the Medusa-040, -060, Eagle040 and Eagle060?
Especially, I'd like to know about the Video and Audio Hardware
of the rumored Eagle series.... ie. Does it have a DSP,
if so which one..etc...

In reply to the Falcon w/powerPC thread,
I am afraid it has to be agreed that Atari can't and won't
reenter the computer business, But I do think that
TT-workstations (Medusa) and new MusicWorkstations
(Rumored Eagle) still stand a very Good chance on the market,
I disagree that the TOS range is expensive, (Save the TT),
The Falcon is about 50% cheaper here then a PC with the
same capabilities, ie. Direct-to-disk, 16 Ch. 50Khz/16 Bit
and all the fun extras like LAN, SCSI-II, Video....And so on...
I have found that all these *standard* extras make the Falcon
a very priceworth machine, The only thing I think is missing is
a bit more raw power, which the Aledged Eagle060 could provide,
Assuming it lives up to the rumor, ie. FULL atleast 32 Bit
architecture, (If not 64-Bit, But that means more $), and
even further Enhanced Audio&Video from the Current Falcon030,
Say atleast a 96001/40 or 50 Mhz DSP and enhanced Bandwidth
to allow for atleast 800*600 24Bit true-color....
But I guess this will once again become to expensive,
What are your opinions?
Also the OS needs a *lot* of improvement, Falcon w/MiNT & MultiTOS
is Sluggish as hell, now the '030 is slow, but It's not *that*
slow....
As someone said, The '030 on the Falcon is not being used for
what it is, but it's used like a turbo-charged 68000, which is
again a real draw-back...
The Eagle series would need an OS which kills the Mac and others..
An OS which is fully MultiTasking and fast, and that runs *all*
TOS software.... (Ie. Built in Backwards emulator...)...
It's been done in PD, can't it be done for real? :)
Plus the software needs to take a turn towards being much
more OS-legal... That'll kill future compatibility problems...

One last thing needs to be said, Atari *could* reenter the
computer business, but not with TOS.
PrEP is the answer.

Just the other way round. You need HDX 3.0x for formatting and partitioning a
Megafile unit (HDX 5.00 does not work, 5.04 sometimes does).
The latest AHDI driver 6.06 works fine with old units, even with SH204 drives.

Must be a 72-pin SIMM w/ 32 bit wide memory on it. A 30-pin SIMM carries only 8
bit wide memory, thus requiring four of them to make one bank of memory in
32-bit systems like Falcon030.

################################################################################
Subject: Email-Organizer
################################################################################

Hallo,

is there anybody who knows a programm which just has the capability to
manage and organize a unix spool/mail-file offline (TOS-offline mail
reader)? Normally I use to download the whole spool/mail - file instead of
reading my icoming email online, so I have all emails and all headers in
one complete file. I tried different uucp-applications (mercury) to find
out a way, but they use special numbers or codes to handle the messages
for incoming and outgoing, and it became to complicated for me (and too
much work) to find a solution because I can't use uucp to connect my
server.

I have a wonderful slip-paket for my 486 PC including a nice mail reader,
but I would like to work on the Atari to manage my emails.
Is there a slip-software for the ST which is not too hard to install ?

If anybody could give some tips, please respond with email, thanks ...

Here's my opinion of John Townsend:

I'm glad to finally see someone from Atari (employee or ex-employee) who we can talk to and get straight answers from. I'm enjoying reading these discussions and hear about what people at Atari REALLY did, rather than some outsider's speculations, especially when that outsider knows nothing about how many engineers it takes to write an OS or even the first thing about software engineering.

It looks to me like Atari was understaffed. If you want to blame someone at Atari for their foolishness, take a look at the Tramiel family, not their engineers. The engineers brought us great computers DESPITE their management.

Saying that PC's and Mac's have enourmous HD's, more RAM, and faster CPU's than older PC's and Mac's is worthless.

You NEED the enourmous HD's, more RAM, and faster CPU's just to run the upgrades to the same old OS and Apps that you used to use. Nothing is any better because you HAD to upgrade your hardware just to keep pace with the balooning software.

When the machines get faster, the software slows down to compensate.

When you get more memory, the software grows larger to fill the extra space.

There's no winning here. Just to run an OS on a PC of Mac, I need more memory than I can fit into a 1040 ST which is ultimately just as capable because the software actually fits in the machine.

The trouble is that the hardware prices are not keeping pace with the growing needs of the software and OS's.

If MiNT and the MultiTOS AES are seperate executables, the new MiNT is MUCH faster, and the old MultiTOS AES's polling is what slows down the machine to 50% normal speed, and there are people writing AES replacements (like part of the Magic OS), and Atari will never release their non-polling upgrade to MultiTOS.....

Why doesn't someone else write a new AES for MiNT 1.12 that does everything that the MultiTOS AES does, except without polling and the major slowdown?

We already have a good kernel, namely MiNT... all we need is a decent GEM interface for it.

What's the deal?

] When the machines get faster, the software slows down to compensate.
]
] When you get more memory, the software grows larger to fill the extra space

Such as programs like Windoze. I find it very hard to believe that it can be written so badly so as to take up around, and over, 10meg of hard-drive space, when we've got programs like Geneva & Neodesk, which I know are not the same thing, but can be stuffed onto a single 720K floppy collectively. Microsoft, and a lot (i.e. the vast majority) of software producers for the PC, just can't be bothered compressing or optimising their code, because they figure that what they make is so "important" that if peoples machines aren't "big" enough, they'll just fork out another $200 and slap a bigger harddrive and faster processor in it. We Atari owners have never had this program, because, as a whole, Atari software is reasonably well written, (with some exceptions of course).

Mac's I can't understand the problem with, other than their AWFUL System 7 and newer that causes similar problems. If they'd stuck with v 6.0.8 or thereabouts, with Multifinder, it wouldn't have made a great deal of difference to operations, other than being 5 times faster. (Obviously, they'd have to upgrade it to handle new machines etc. But you get the idea). From what I've seen, most mac' software is also pretty well written. PC software is a problem - although, a lot of the size is to support the dozens of different graphics modes and sound-cards. Most of which is un-needed, as the majority of the cards will emulate each-other...

I've only got a measly 30meg hard-drive on my ST, and even with nothing on it compressed, I've still got about 16meg free, and that's with several comms programs, DTP, wordprocessors, a spreadsheet, various disk utilities, Geneva, Neodesk 4, etc. etc. Try stuffing the PC equivalents into 30meg! Just a single wordprocessor on the PC can take all of that... (Word 6 for windows I think is the latest joke...)

"Quick-Index" will tell you the RPM of the disk drive, as well as a
performance reading for GEMDOS I/O performance, but won't tell of actual
"K per second" which I suspect is what you want. I can't think of
any program that is the floppy equivalent of RATE-HD (A Hard-drive
access tester), although there probably is one.

look for:

quikdex.arc in ./atari/Utilities/ on atari.archive.umich.edu.

(There's also quickst.arc which is a poor-mans Turbo-ST/NVDI/Warp-9,
which does make things a bit nicer to use, by (from memory), turning
off those STUPID Zoom-Boxes in GEM which I can't find anything else
to do under NVDI on an STe.)

> that day.

Whilst I agree that MTOS is more than a match for DOS (don't know about MAC System 7.X) - I think you're being over optimistic concerning Atari's ability to re-enter the computer market.

Things were different in 1985. The 8 bits were dying and PCs & MACs were far too expensive. There was quite a large area in the market place for a home computer like the ST.

Nowadays PCs have the market sown up quite tightly. Sure there are a lot of MACs out there - but it is PCs which dominate.

For Atari to enter the computer market again - and suceed - they need a machine that people will buy *instead* of the PC. It must do everything the PC can do (ie be DOS/Windows compatible) - but also do lots more. Its got to be cheaper than an equivilent specified PC as well. Remember PCs are what people are comparing everything else to - and PCs is a 'standard' (if a poor one) *not* just a machine from a different company.

I just don't think its possible - unless they chucked so much money at it - they could afford to sell a truely advanced machine at a loss leading price.

Alternatively they could go for the niche market - but in many respects the Falcon has already tried this in the music/video market. Maybe Atari didn't spend enough on promoting it - but also many people would have been put off by its proprietry design.

This is no criticism of Atari BTW. I think that *any* company would have a hard time establishing a new non games standard in computers. Just look how much money IBM are throwing at OS/2 - its supposed to be a better Windows than windows - but even with its high level of compatibilty and low price, people still stear clear of it.

Roland.

Does Atari even have a non-polling MultiTOS? I have seen AES 4.1 and
it was faster, but I think it does polling (AESSYS process still took
some 40% of the processor time according to top.ttp).

>Why doesn't someone else write a new AES for MiNT 1.12 that does

That would really be great. But I think it's far from easy to do.
If I were enough good programmer to do that, I would be coding it
at the moment.
We could start that as a project, like MiNT, so that everyone
who were up to the task could develope it. Just speculating, I don't
really think there is enough people willing to start that kind of
job :-(.

I've made software for the ST that can use the build-in paralell-port
transfer system in the portfolio. It's very fast. To use it all you
need is to buy it (and to make a small change to the paralell-cable)

The other option is RS-232, but then you need to get a comm-prg for
your portfolio, and you need a way to get it on to the portfolio :-)

PortLink ST File transfer between Atari ST/STE/TT and Portfolio
""""""""""" """

PortLink ST is a small easy-to-use GEM-based program that uses the
parallel-port on your ST/STE/TT, a patched parallel-cable, and
the Portfolio's parallel-port and build-in file transfer system.

To use PortLink ST you need a parallel-port and cable for your
Portfolio. Then you need to buy the ST-software I have written,
and you need to patch the cable (that's included in the price).

BTW: The transfer speed is much faster than with the PC-version !

PortLoad VT-100 communication software for Atari Portfolio
"""""""" """

This is a fully-working demo-version of a communication program
for the Portfolio developed by a employee at Atari in Norway.
The program supports 80x25 screen emulation and file transfers.

Stick in a dedicated tape controller and you are down to 30 minutes. Still pretty abysmal though.

But there are certain things where you need a minimum amount of memory (C++ development for example) and the ST is crippled because it cannot be easily expanded above 4Mb. The TT and Falcon are much better off as they can do VM if needed.

> There's no winning here. Just to run an OS on a PC of Mac, I need
> more memory than I can fit into a 1040 ST which is ultimately just
> as capable because the software actually fits in the machine.

Though there are just some things the 1040ST is not up too because of this lack of memory. True 4Mb goes a lot further on an Atari then it does on a PC.

> The trouble is that the hardware prices are not keeping pace with the
> growing needs of the software and OS's.

I'd disagree. Taking inflation into account, I would say that 'suitable' hardware is just as cheap if not cheaper than it ever was. 800ukp worth of 1986's money would by a basic ST setup. Nowadays 800ukp would buy a reasonable PC setup or even a Falcon ;-) With the inflation aspect the actual value of the money today would probably buy a decent PC - maybe even a basic Pentium.

Of course what you consider to be 'suitable' is entirely up to you, and I'm not advocating PCs over Ataris.

Have you tried STree (1.04)? It's the only other one I know of that
can search for files that contain a substring anywhere within their
names.

It's got a decent interface, and the docs are in English.

> CPU time.

Having just bought a PC (to go with my TT) I can answer this one. I'm no stranger to SCSI. I understand SCSI much better than IDE and believe SCSI to be far superior to IDE. I also always said that any PC I bought would be SCSI through and through.

However when it came to the crunch, having a small IDE drive to boot from (like the Falcon) actually seemed like a good idea. You then do all the real work on a large fast SCSI drive. Two reasons for this:

1) Compatibilty. PC software which gets 'clever' still get a IDE drive to play with.
2) Cost. IDE drives are dirt cheap so you might as well have one for all the boring system files.

Actually point 2 is the problem. IDE drives are *so* cheap that you can't buy a small one anymore. The price difference between a medium (200Mb) and a large (540Mb) is only about 50ukp. Needless to say I ended up with the larger of the 2. Hard disk space is always useful - even if it is 'slow' 10ms IDE disk space ;-)

The interfaces are cheaper as well. A SCSI card is 50ukp - 200ukp, whereas an IDE one is about 10ukp and its often combined with the IO card.

Okay so I've obtained a second hand decent SCSI card for the cost of a new cheap one - so I can run my SCSI CD-ROM on the system. Also whenever I buy a tape backup unit, it will be SCSI too (I still have a TT to back up).

> wouldn't spend a dime on a system with IDE disks... I'm VERY fanatical
> about SCSI. And I wouldn't waste a dime on DOS or Windows or a serial
> mouse.

I think *most* people in this conference would consider that to be a decent system (except of course that it is a PC and not an Atari of course :-)

In absolute computing terms - it stinks. But then so do all PCs. PCs are not a particularly good design - and no matter how good the implementation, a bad design is a bad design. I like my TT better (even though its crippled as well), but I've decided not to be isolationalist. I not whether I'm an Atari or PC owner. I'm both now - and have the best of both worlds.

> And, gee, you've still got that IDE disk. Sure hope you don't want
> to add a DAT and a CD-ROM... And then there's the other liability

Whats the big problem adding a DAT and CD-ROM to an IDE system? My SCSI CD-ROM co-exists quite happily with my IDE drive.

But I'm not advocating VGA as an optimum resolution. I'm using TT-Hi at
the moment (1280x960 paper white). Its standard and gives you masses of
screen space.

> I really wish someone would post the component costs for a system like

> accelarated video card capable of 1024x768x256-colours (but preferably
> 1152x900x256), decent 17" monitor.

As long as you require such a graphics adaptor you won't get a TT for a
reasonable price. A basic 256 colour adaptor is 200-300ukp. A really decent
one is 1000ukp. This prices just do not compare to PC SVGA cards - and bump
the price of the TT up enormously. If you want high res colour - buy an
accelerated Falcon or a PC. The TT can do better than the Falcon, but at
twice the price.

> Did I leave anything out? I have no idea what software I'd put on
> it... maybe FreeBSD or Linux. NEXTSTEP would be wonderful, but it'd

Well it looks like my TT is going to end up as a Linux workstation. Even
when the TOS market dies - I'll be able to recompile freeware Unix code
onto it. OTOH by then I just might not care. The TT might look distinctly
underpowered in a couple of years time.

...actually $560 (or less)

> RAM adapter card -> ~ 300 US
...I don't know about this one

> 2M VRAM video card -> ~ 800 US
...this is about right

> External SCSI CD-ROM -> ~ 600 US
...wow! try $199 for double-speed units from a dozen places

> 17" Sony Trinitron -> ~ 900 US
...or maybe $650 for an excellent 17" CTX (flat screen, full scan...)

> Total -> ~$5880 US
...actually, under $4,000 (so, you were off by 50%, what's $2k amongst
friends? :-)

> Prices are higher in Canada. If you can find someone to sell you the TT
> or the TT video card.

This may be true, but most U.S. dealers are happy to ship to Canada.

You are correct in that there is a premium attached to certain aspects
of TT systems, namely video cards (around 4x PC costs) and RAM adapter
cards (not needed on a PC). Plus, the base system is rather pricey,
considering what you're getting. But all the peripherals are no more
expensive than for any other platform. In fact, they're interchange-

able.

Of course, if you could run ST software on the Mac hardware, there are plenty of configurations with as much or more raw horsepower than the TT (and better video built-in), at a much lower price. Perhaps, some day, you will be able to.

> I'll start the game,

Boom, there you go. It is not really a game. It is more of a "simulation"
designed to occupy and interest a small child. Another thing that might be
causing problems is that the LCP rolls along at a very sedate pace (again in
the interests of a small child, one might suspect).

> (enter the stuff into the book, name/date) the game will
> start with my little computer person coming onscreen and banging constantly

> at the typewriter too).

Well, when you type stuff, does it appear at the top of the screen? I always
hit return a couple of times after each thing I type. Also, you have to
wait awhile for things to happen (and typing multiple things probably
confuses the LCP). Try asking him to type you a letter, then leave it
alone for awhile. Eventually, he should ascend the stairs, go to the filing
cabinet and get paper, and start typing you a letter.

> I'll ask "please type me a letter" or "please open the door" but he won't,

The thing I found to be most cool was just watching the little dude (throw
him food and water every once in awhile to keep him in good spirits).
Activision did a good job of making these little folks individualistic.

Good luck!

>
> 1. Can the ST floppy drive controller cope with HD disk drives?

My understanding is that HD floppies can be "rigged" for use as DSDD
floppies with little effort. See the files ibmfloppy.lzh and genflop.lzh
on atari.archive.umich.edu (look in the index file for location). I don't
know of a file specifically dealing with HD drives, but there might be one
there somewhere (again, look in the index).

> 2. Would I be able to write data in HD format from commercial software,
> e.g. Cubase ? (I would be happy to format disks with special software)

Not without some additional hardware. However, I see that you are in the
UK. I have seen inexpensive HD kits for the ST in UK magazines for quite some
time, so I presume that these are pretty easy to find there (not here, that's
for sure).

> RS Components supply a Panasonic drive which "is able to operate in both
> normal (1Mb unformatted) and high density (2Mb unformatted) modes"
>
> 3. Would a drive like this allow me to read DS DD or SS DD disks (even if
> only through special software) ?

I don't think you need special software to do this. For example, on a
MegaSTE equiped with a HD drive, you just stick them in and it will figure
out the SS/DS/HD thing. I am presuming that the HD kits sold in the UK
give equally seamless functionality. There is already a precident, after
all, as one can use SSDD floppies in a DSDD drive with no special software.

> Any advice gratefully received.. and any suggestions of cheap UK sources for
> replacement drives are welcome.

Here are some possible cons:

1. I have heard that HD drives are not compatible with some types of
copy protection. In other words, some games might not work for you.

2. You'll probably have to cut up your computer case to get it to fit.

I recently upgraded a 520STFM in several ways, one of which was the replacement of the SSDD drive with a DSDD unit. My strategy was to purchase a used SF314 drive (Atari DSDD external unit) with the proper eject button configuration. There are at least three types: long thin parallelogram centered under disk hole, small parallelogram to right of hole, small rectangle to right of hole. I just bought the right type, pulled out the mechanism, and plunked it in. It works perfectly. Oh, note that the cable will probably have to be plugged in upside down (so you'll have to shave off the little "key" on the connector so it can be plugged in the wrong way, amazingly enough). On the up side, you'll have an external drive enclosure you can play with (perhaps creating an external HD drive, which would make more sense if the game compatability thing turns out to be true). I'd much rather be experimenting with an "extra" drive, not the one that the computer needs to be useful :-).

Hope that helps.

Have you ever run your MODEM2/SERIAL2 ports at high speed successfully? I ask because I have a MegaSTE as well, and both of those ports are quite buggy (this is a known problem with early MegaSTEs). I have instructions for fixing them both, though I have not yet applied them to my machine (email if interested). Anyway, a good way to test this would be to use the program on MODEM1 at 19200 baud. If it works fine, I would suspect that you have some/all of the same firmware bugs that my MegaSTE has. Good luck!

4029. Octave for Atari

Newsgroup: comp.sys.atari.st
Date: 1994-11-28 06:25:31 UTC
From: h54118@sakura.kudpc.kyoto-u.ac.jp
Message-ID: <h54118.786003931@sakura>
Source record: 175854

Dear everybody;

Does Octave exist for the Atari?
Octave is a freely available replacement for Matlab, thus a very
powerful matrix manipulation program. In combination with Gnuplot it
also has great graphical capabilities.

Matlab's source is of course not available (only a very limited old
FORTRAN version..., even bins for Atari) and Octave can run Matlab
scripts with (minor) changes. Thus it seems very useful to have Octave
running on the TT/Falcon or so.

There is a Linux source available but I have no idea about Linux yet
Linux on TT/F030 yet.

If nobody has ported Octave to TOS yet, let's try!

Any info/suggestion appreciated.

Christian Goltz

>I missed a few months of c.s.a.s. and never saw this type of description.

MagiC 2 uses about 300k of RAM. A recommended setup would be 4MB RAM and a
hard disk. It is very efficient and faster than TOS. MagiC 3 (not out yet)
will probably use a little more RAM.

In general, MagiC will work faster on the same machine than any version
of TOS. To enjoy the benefits of multitasking, however, you should
have *at least* 2 MB of main memory.

4033. TADS 2.2.0.5 available for Atari ST/TT/Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-11-28 07:34:49 UTC
From: dmb@case.ai.mit.edu
Message-ID: <3bc16pINNhs2@life.ai.mit.edu>
Source record: 175859
Cross-posted to: rec.arts.int-fiction,comp.sys.atari.st

I've updated the Atari version of TADS to the latest released version,
2.2.0.5. This adds many nice features, but I've made no major
Atari-specific changes.

The file:

ftp.gmd.de: if-archive/programming/tads/atari.tads2exe.arc

If you don't know what TADS is, check out the Adventure Authoring
Systems FAQ:

rtfm.mit.edu: pub/usenet/rec.arts.int-fiction/Adventure_Authoring_Sytems_FAQ

I have not ported the debugger yet.

Hello everyone...

Just to inform everyone that there will be no activity in the HENSA
Atari section from the coming weekend...for the next 3-4 weeks, as I
will be away from the office.

I apologise for this, but I will be taking a much needed rest. I will
return back to the office on 3 january, 1995...and on the 4th will
again be away, at a conference. So The Atari section will come alive on
the 5th.

I will miss you all, and doing what I do in the Atari section. In the
meantime, till i am away, if you want to upload anything yto HENSA,
then please do so...or uuencode-mail me the programs. They will go
on-line before my holiday.

Best Regards to all
Danny

You don't need startgem on your TOS. Just set Gemini to boot as the
first GEM application through one of the Atari desktop dialogs.
Forgotten which one, I never use it any more :-)

An English version of Gemini 2 is being worked on by Coe COnnor
(jconnor@cix.compulink.co.uk) and Danny Bhabuta
(danny@micros.hensa.ac.uk). ATM they are waiting for some tools from
the German author so they can create the .msg file.

I can mail you my English .msg and .rsc if you'd like, they aren't
perfect but...

actually I much prefer the german atari groups myself, the noise/signal ratio
is much better. especially in the maus* groups. de.comp.sys.st isn't used that
much I think.

since they are in german though, distribution has always been limited and you
have to find a friendly nntpserver in germany usually. (They usually stop
being friendly when 6458 remote nodes start grabbing abpe.*, so at the moment
I don't know of any myself..)

Cheers,

Torbjørn Ose - to@hihm.no

>reenter the computer business, But I do think that
>TT-workstations (Medusa) and new MusicWorkstations
>(Rumored Eagle) still stand a very Good chance on the market,
>I disagree that the TOS range is expensive, (Save the TT),

I don't think they do now I'm afraid. They are expensive compared to PCs, and
although we might consider it money well spent on a better machine, I can't
see them selling in large numbers even if they were cheaper.

>The Falcon is about 50% cheaper here then a PC with the
>same capabilities, ie. Direct-to-disk, 16 Ch. 50Khz/16 Bit
>and all the fun extras like LAN, SCSI-II, Video....And so on...

A moderate speed PC with scsi hard disc and a good sound card can do all this
and costs the same or less than the falcon, at least here.

>a very priceworth machine, The only thing I think is missing is
>a bit more raw power, which the Aledged Eagle060 could provide,

Yes, an '060 should be faster than a pentium, and of course you wouldn't be
running Windoze on it :)

>even further Enhanced Audio&Video from the Current Falcon030,
>Say atleast a 96001/40 or 50 Mhz DSP and enhanced Bandwidth
>to allow for atleast 800*600 24Bit true-color....

No, I think they have to stick with the 56k now for compatibility. A faster
one would be nice though, although I think speeding the main processor would
be more useful.

Enhanced bandwidth will come with a faster processor, but I think for that
kind of resolution they really need seperate vram, preferably dual port.

>But I guess this will once again become to expensive,

dual port ram is expensive.

>Also the OS needs a *lot* of improvement, Falcon w/MiNT & MultiTOS
>is Sluggish as hell, now the '030 is slow, but It's not *that*
>slow....

As many people have said, if and when they release the versions of MultiTOS
they have in development, it will not be slow.

>As someone said, The '030 on the Falcon is not being used for
>what it is, but it's used like a turbo-charged 68000, which is
>again a real draw-back...

Not much of one. In PCs the 386 is used as a turbo charged 8086 which did hold it back, but the difference in architecture between the '030 and the 68000 is much less significant and optimising code for the '030 will only have a few percent speed up at most.

>The Eagle series would need an OS which kills the Mac and others..
>An OS which is fully MultiTasking and fast, and that runs *all*
>TOS software....

MiNT and MultiTOS runs most, and will be fast with multitasking etc.

MagiC already is fast and multitasking, although not quite as sophisticated as MiNT.

They run all gem applications and text mode applications. Other applications generally don't work very well on different screen modes etc anyway.

> (Ie. Built in Backwards emulator...)...

I don't see that as necessary, since the only things that need that are a few games, written badly or at least without much thought of the future.

>Plus the software needs to take a turn towards being much
>more OS-legal... That'll kill future compatibility problems...

I think software already has gone that way. With new machines, and with various multitasking operating systems I don't think anyone could get away with releasing software that wasn't these days.

>One last thing needs to be said, Atari *could* reenter the
>computer business, but not with TOS.
>PrEP is the answer.

In that case though they would have to try and sell more or less identical hardware to other companies at a lower price, which I think they would find difficult. They would not even attract loyal atari supporters if their hardware is identical.

What atari have always been good at is producing exciting new hardware (even if it's not so exciting or new by the time they release it) and these days no-one wants exciting hardware if it isn't PC comp

Basically it finds out how many sectors per track and reads that many sectors repeatedly. Gives strange results on floppy look-alike ramdiscs, cached hard discs etc :)

>performance reading for GEMDOS I/O performance, but won't tell of actual
>"K per second" which I suspect is what you want. I can't think of
>any program that is the floppy equivalent of RATE-HD (A Hard-drive
>access tester), although there probably is one.

Rate-HD tests the speed of the drive and interface. The program you want is called how-fast, and tests the actual read and write speeds of the drive obtainable by a real program ie tests the operating system, filesystem and drivers as well. It works on all drives including ramdiscs, and plots a graph of speed against block size. This graph will normally be a curve that tends towards a value as the block size increases, this is the sustained speed of the drive.

I got it from a local BBS, but it is probably on most ftp sites.

Hi.
Can anyone tell me if there is an FTP site which has Stereo (or non-Stereo)
MOD music files? I know this is a common Amiga format too, so should I be
looking in the Amiga directories also (aaargghhh...)?

Thanks,

Brian

Hi there,

Does anybody have any recomendations for using SLIP on a 1Mb RAM Atari ST. I know there is KA9Q based software out there, but it is rather confusing with the different packages. Has anyone any useful suggestions or recommendations??

I believe that there is a collection of software developed for use with Demon Internet services in the U.K. Has anyone here got direct experience and can recommend this stuff?? Where can I get hold of it??

Cheers,
John

Hello Rob,

I'm using Ghostlink with a Mega STE4 and a Compaq LTE-Lite/25 (386SX) notebook, and it works fine. I connected the Mega STE4 with the serial2 port to the com1 port of the notebook. On the Mega STE I don't use any patch-programm. The maximum speed I get when I'm reading the C-drive of the PC is 57600 bps, but when writing to the C-drive the best maximum speed is 38400 bps, at higher speed I get errors and retries. The speed is limited by the Mega STE, because it cannot go faster. This is due to some hardware bugs in the Mega STE.
When the program on the Mega STE seems to hang up, it is constantly trying to get contact with the program on the PC, I get this when I try to read the C-drive when I haven't started the slave-program on the PC yet.
Have you tried it with another PC ?

Greetings, Luc

Get out of here! Tell me the name of the PC-soundcard that can do 16
separate/simultaneous tracks of 16bit Digital Audio in 44,1 or 48 KhZ
(direct to/from hard disk), and I'll show you an elephant
wearing Camel Boots. :-) And the system with 0.5 Gb SCSI Drive should
not cost more that 2000 pounds (20000 finnish marks), Including programs!

Remember: Digidesign 8-track system costs 3 times the price of the Falcon,
and in Cubase Audio Falcon there's also a complete Midi Sequencer with
prof. notation running at the same time/in sync (inside a same program!).

% In one of famous Atari ftp sites I found sources of old gnu c (v 1.xx)
% compiler configured to give DSP code. It can be compiled on many systems,
% but of course not on Falcon. I was trying to configure it for Atari, but
% it doesn't give good results. I wonder if someone tried to compile this
% GCC, and can help me with this problem.

I compiled this last night on the Falcon. You have to set the target
to
sun3-dsp56 or something like that. Do a 'config.gcc sun3-dsp56' which sets
up links to tm,md, etc (all the gcc stuff). After that it compiled without
a hitch, once I'd removed references to bcopy,bcmp,bzero. (Do we *have*
to have these in string.h - it seems to cause more problems than it solves)

Anyway, once compiled I got g56k, g56-cc1, and mccp. I installed them
and
g56-cc1 bombed whenever I called g56k. That was 12:30 last night so I haven't
got any further...

The program I tried was simply:

```
int main()
{
TYPE a;
TYPE b;

a=5;
b=a*a;
}
```

with TYPE set to int or float. Neither worked. I plan on trying to set
up to do a similar Xcompiler, just to see if it'll work. I'm a
bit mystified why g56k doesn't, because I don't even remember any error
messages, apart from those I fixed...

Anyway, that's all as of now.

Simon.

Eric March (diehl@nudge.io.org) wrote:
: Jo Even Skarstein (josk@Lise.Unit.NO) wrote:
: : I don't understand why people are still arguing about this. There is *no*
: : question that the average PC (DOS/Windows-computer.) have several advantages
: : over a normal Falcon.

: : 1) It's a lot faster.

: Granted; but that can be readily ameliorated by the purchase of an
: accellerator board for the Falcon...

Oh, so you must be the first Falcon owner who's cpu operates at the same
clock speed as my DX2 66.

: : 2) It's got slightly better (But not very versatile) graphics cards.

: Falcon's video modes are programmable.

Whoopee! My video card allows 64K colours at 1024*768 resolution

: : 3) Better sound (Most people have a SoundBlaster or a GUS.).

: The DSP kill ssoundblaster.

Why? What does your DSP do better than the soudblaster AWE32? You'll
probably need to think about this for a while...

: : 4) Better keyboard (Which is quite important.)

: I much prefer my ST's keyboard.

Suit yourself! Personally I prefer a nice mechanical keyboard, freely
usable away from the tower it's connected to.

: : 5) Cheaper hardware.

: The Falcon uses standard SCSI-2 and IDE hard drives. No advantage either
: way.

: : 6) More software available.

: This is true; but the PC has its entire software libreary available at the
: expense of backwards compatibility back top its 8-bit days, which has
: severely hindered the PC's advancements in terms of raw power.

I severly unfounded statement I feel. Chech your facts first.

: : Anyone who hasn't understood this propably owns an Amiga...

Not quite sure why we need to drag this machine into the discussion.

: : So what? I use a lot of different OS/computers, but I prefer my Falcon. OK,
: : the PC's are faster, and the SGIs at school are "better" in every sense, but
: : IMO they suck. I've got the programs I want (Hey, I've even paid for some
: : of them!), the OS is so much faster and nicer, and I've got lots of friends
: : with Ataris. So if anybody thinks that the ultimate thing is to own a PC
: : because
: : that's what everybody else owns, they have missed something. The lack of
: : individuality makes these people pathetic...
: :

I feel that my PC is as personal to me as my Atari ever was.

: True ... I prefer my ST to the PC in every way. I've used PCs extensivey
: and have _never_ liked them ... I don't like the OS (any of them), I don't
: like the architecture, and I most certainly don't like the complete
: modularity of design. I'll stick with Atari; they have everything I want in
: a machine, and it does things the way I want to do things with a minimum of
: fuss; the PC is nothing but constant editing of your AUTOEXEC.BAT and
: CONFIG.SYS files.

What a load of BOLLOX - I can't believe that you just turned a
reasonable argument into a farcical blithering with your last statement.
I spent nearly all my time on my Atari tweaking files left right and
centre so as to make the damn thing work! Tweaking the .sys and .bat
files of the PC is merely to make it work BETTER.

Everything I ever did on my Atari required a large amount of fuss, and
still bombed for no real reason half of the time.

4057. STOS and Falcons

Newsgroup: comp.sys.atari.st
Date: 1994-11-28 13:18:39 UTC
From: geoff@damp.apana.org.au
Message-ID: <3bclbf$2o3@frisbee.damp.apana.org.au>
Source record: 175850

Hi all...

I am after a solution to a problem I have with running STOS on a Falcon.

I have used STOS on an ST for quite a while, and have tried to get it running reliably on my newer beast. I have used all the fixes I can find (STOSFX14 and STOSFX27), and have it running, but every 6-10 seconds the keyboard throws a '3' at the editor... most inconvenient when you are trying to edit a file.

Is this the best I can expect, or have I now buggered up the boot files putting then through so many fixes!!!

Any help much appreciated.

Geoff

Source record: 175883
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi,
I wonder if anyone can help. I am looking for a guide that tells me the speed of instructions on the 68000. In particular, I am trying to find out how many memory-to-memory ADDs can be done per second. Also, does the addressing mode affect the speed.

eg, is ADD.W (A0),(A1)+
faster than ADD.W (A0)+,(A1)+ ?

The reason why is that I am helping to write an FFT program in DEVPAC, and I need to find the fastest instructions.

TIA,
Steve

P.S. Email replies preferred, but posted replies OK.

:
:Anyone with the mentality to place Llamatron against Doom needs to wake
:up. Quickly.

yes, I fully agree! I do not see why atari users are too proud to admit
that their machines can not compete with PC's. Comparing an ST with
a 486DX2/66 is stupid (and I know, i have both of them). I don't mind
the 486 being the faster machine, having more software, much much much much
better games etc. I still use my ST and really like this machine.
yeah yeah, I know, atari has a TT etc. sure. now look at the how much a TT
costs and compare it with a 486. Look at the amount of software for the TT
and compare it with the amount of software for the 486. And still I would
like a TT. You see, there is more to it than just speed/software etc.
I just _like_ the atari computers, like the hardware etc. We all do.
But don't close your eyes and dream that atari are the superior machines
these days. It is just not true.

BTW. IMHO there will never be a game like Doom on an atari (except the
version for the jag, maybe). I heard a lot about this game and this
weekend I got a copy for my 486. I was astonished about the graphics of
this game. I had never seen anything like this. it is fabulous.
check it out, and then go and play Llamatron or Starball......

I don't really think this will work!!?? Will it??
As far as I know the syntax for 'add' is:

add.x Dn,<ea>
add.x <ea>,Dn

That makes it about 0 add's/sec.
Usually (An) and (An)+ uses the same amount of CPU-cycles!!

Stefan

John Townsend (John_Townsend@taligent.com) wrote:
: During the 1985 to 1989 timeframe.. Atari released the 520ST, 1040ST,
: the Mega2 and Mega4 as well as work on things like STPad and STBook
: as well as the ST Portable. When you add the Laser Printer, GDOS, the
: CD-ROM player, and some networking stuff that never made it, you have
: quite an array of hardware projects that were produced.
: For each one of those computers than was released, TOS had to be brought
: up and tested on each one. This took time. In the case of the Mega machines,
: this meant a BLiTTER chip. The addition of this chip required a complete
: rewrite of the lower levels of the VDI subsystem.
: When you consider than Atari had a staff of about 12 people working on
: TOS (at the most, usually less than that).. you begin to understand that
: we are dealing with a resource problem. Atari simply didn't have the staff
: to do everything it wanted to do. Now, remember.. I am not slamming
: Atari for this. Every single company in the world has this problem. They
: have to make decisions on what they need to do and what they have the
: resources to do.

When I look at Magic I see a staff of 3 people working on it. They have
designed that operating system during the last, say, 4 years. The
operating system is stable and comatible. Besides, 2 of the programmers
have developed NVDI 3.01, a full rewrite of the buggy full rewrite of the
atarigraphicsroutines called VDI, and at the same time replaced Speedo
GDOS. They have manaaged to port that system onto another plattform, the
Macintosh. They have succeeded in supporting (see NVDI) an array of
graphics cards with different grpahic processors. Let us take two more
people into account, T. Tempelmann and the guy, who wrote Ease, we have at
total 5 people working on Magic/NVDI/Ease. Add anaother programmer for
systems extensions (WinCom) we have at MOST 6 people working on Magic and
essential tools nearby.
These people have to do a lot of work besides programming. B&B, the 2
programmers, have to run their own company, meaning doing customer and
programmer support, arrange for packaging, doing the accounting, dealing
with lawyers on some occasions etc.; one other guy is responible for a lot
of system tools, and still supports and develops a Modula 2 development
system.
Conclusion: these people are also hard on work. Counting at most 6
programmers having done a better job than the 12 at atari, having done
the work from scratch and in only half the time, they have worked 6 to
seven times more productively than their counterparts at atari.
How do you explain that?

:So, please.. don't get the idea that the engineers at Atari were sitting around
: drinking coffee and playing video games during the four years between TOS
: releases. They were actually doing alot of stuff.

I am certain that those guys developing hardware were really into it. I also think that Eric Smith is doing an excellent job there.

BTW, it was said by you, that Atari had a special person, full time paid, to do the documentation. What happened to his work? (although, it seems odd that atari having that much ressource problems pays a person just for documentation...)

Marlin,
I stopped payment on that check because you sent me a pile of
junk. I couldn't get my computer to recognize either drive, and
when I took it in to have it look at they said that they
couldn't either. They said that the setup that you have,
having another hard drive hooked up to a Megafile 30 controller was
simply awful. Also, more than 100 of the Megafile 30 sectors were bad.
I'm sorry for not getting back to you soon as I
threw away your Email address. If you want the stuff back, and
you want to pay for shipping, sent me your address.

-John

>I've heard rumor of a product called MacMagic that will supposedly run Atari
>software on a PowerMac? If anyone has the scoop on this could they fill the
>rest of us in on it?

Well, it is rumor no more. The MacMagic booth at the Bonn proTOS was showed
macMagic running on several different Apple machines, and a lot of the dealers
present at other booths were really excited at this development. They see it
as a way to expand the market for their atari software into the mac area.

Calamus, for instance, is a very good DTP and has a price/performance ratio
few Mac applications can match.

As I understand it, macMagic runs as a task under Multifinder and allows data
exchange between Atari and Mac side.

The R.O.M. representative told me that his company has just hired a hardware
expert who will design some things that will make macs more compatible with
Atari's (midi, true paralel interface, two button mice).

>: accellerator board for the Falcon...
>
>Oh, so you must be the first Falcon owner who's cpu operates at the same
>clock speed as my DX2 66.

It should be pointed out that a DX2/66 only has an external bus speed of 33 MHz, and is internally clock doubled. That means that the local bus can be running at 33Mhz. Most stuff isn't on the local bus however, and is in fact on the MUCH slower ISA bus. I do mean MUCH slower -the ISA bus was designed (well, conglomerated), quite a while ago as a kludge on the original PC architecture. The devices on this bus are in fact accessed at a slower rate than a standard 8Mhz ST accesses it's devices.

The CPU speed isn't everything, and although the intel chips in PC's are quite powerful (but not in the same league as the MIPS, ARM or PPC chips in terms of cpu power VS cpu price. And taking into account the power consumption of a x86 class chip, you see that they are very inefficient. However, that aside, they are still a powerful processor.

The point is not one of CPU power, but of system architecture. The basic premise of having an open & expandable architecture is a good one. But the PC standard is a bad one for this, which is imposing a stranglehold on the advance of computing. The speed of the bus used in a PC is ridiculous when compared to that of the CPU - all that happens is that the CPU blasts through it's task mighty quick then sit's and waits for the rest of the system.

Better bus systems exist for open architectures, so that is not a real justification for maintaining the PC (I would hold FutureBus+ up as an example of one such architecture).

>: : 2) It's got slightly better (But not very versatile) graphics cards.
>
>: Falcon's video modes are programmable.
>
>Whoopee! My video card allows 64K colours at 1024*768 resolution

True, a PC tends to have a better video subsystem in terms of maximum res - however, you must bear in mind that games will generally not use that maximum res due to the inherent difficulty of doing complex mannipulation

of large amounts of VRAM in the PC architecture (to much paging). You
will find that a written for falcon game will use exactly as much video
memory as it needs, and will be able to shift it around at a pace that the
PC can only dream of. And I don't mean the Doom style things, which are mostly
maths based - although, the falcon can in fact do Doom FASTER than an average
PC (I've seen a demo, and hopefully Griff's next release will blow that as well).

>: : 3) Better sound (Most people have a SoundBlaster or a GUS.).
>
>: The DSP kill ssoundblaster.
>
>Why? What does your DSP do better than the soudblaster AWE32? You'll
>probably need to think about this for a while...

Support. That great reason for buying a PC. Few people actually own an
AWE32, and few softs explicitly support it's advanced features. With the
DSP, all falcons have it, so almost all falcon software for audio has
support for it. Games use it for their soundtracks - routines are in the
PD - even basic programmers can use them :). There is no reason not to,
as every f030 owner has one.

>: : 4) Better keyboard (Which is quite important.)
>
>: I much prefer my ST's keyboard.
>
>Suit yourself! Personally I prefer a nice mechanical keyboard, freely
>usable away from the tower it's connected to.

I personnally never had a problem with the standard keyboard, but if it
really stresses you, you can plug in a PC keyboard instead (PC approach
creeps in here - you'll need a plug in card to do this).

>: : 5) Cheaper hardware.

>: severely hindered the PC's advancements in terms of raw power.
>
>I severly unfounded statement I feel. Chech your facts first.

No - check the architecture of DOS & Windows. The current versions of these
are severely hampered by the need to maintain compatibility with an architecture
designed to only have 640K of RAM. Any more has been kludged. And DOS
has not moved in terms of real solid features since it got directories.
Also, think that DOS & TOS both have a common ancestor in CPM, on which
they are both based. TOS added proper memory managment support, and then
quantum-leaped with the advent of the MiNT kernal.

A MiNT kernal is more than a match for any existing version of DOS (you
want long filenames ? no problem. Networking? thats in there to. Multitasking?
fine, take it away. Posix? great....

There are OS available for the PC which eat MiNT for lunch (eg. Linux, NextStep),
but most PC owners just use DOS/Windows, crippling their machines.

Things in the last post deteriorated around here, so I'll sign off.

There is a lot to be said for Llamatron (well at least on the Atari, the PC version stinks). It is based on one of the real classic arcade concepts. It doesn't fall back on a flash gfx engine to get it's pull. It goes for the original arcade concept of reflex and adrenaline rush. As do most Jeff Minter games (Llamazap & T2K follow this line as well).

Starball is another kettle of fish, and provides a game which actually has more depth than Doom can ever have. The doom engine could go on to produce a game with depth, but hasn't so far (although AvP on a Jag takes the style some way along that route). Starball requires more though than Doom, and also provides the same sort of arcade reflex hook as Llamatron (but not quite as intense).

I have played Starball, Pinball Dreams and Obsession, and I can only say, Obsession is DEFINITELY the winner. The excellent music, the superb sound, the fantastic scrolling makes my STE look and sound like a Falcon. It has huge playability; I've been playing it all day, and still I'm looking forward to playing it again tonight. Starball's superb for a PD game, but it can't beat Obsession.

Cheers,

Dave.

In referenct to AvP's resolution (which I complained about) I recieved several of the following sort of messages;

> More likely, it's a case of TV's having difficulty handling that
>kind of resolution. Most Jag owners don't have monitors and TV's (as we
>all know) run into problems when the resolution passes 320 X 200.

Unfortunately I'm already running on the Atari SM1124? (you know the old Atari Color that I got with my ST). This certainly does look far superior to the tv set, but trust me, *none* of that action is at 768*512 or whatever it is the Jaguar claims to run at. It looks nice, sure, but not beautiful like it could. Also, they could have done more with so many things; for example, why not make the tables look nice instead of looking like they do? Why not just map a texture of some sort on them? The intro screen is certainly looks hi-rez, but that's not as important as the game.

My guess is that it's a limited memory problem,a cartridge can only hold so much info and high-rez graphics take a lot of space to store. Hopefully the CD-rom games will use the full resolution!

4080. Samples

Newsgroup: comp.sys.atari.st
Date: 1994-11-28 17:07:14 UTC
From: smoore@chowgar.demon.co.uk
Message-ID: <786042434snz@chowgar.demon.co.uk>
Source record: 175836

I know this isn't exactly an Atari specific but as I use a Falcon I hope it will be tolerated. I was wondering if there are any FTP sites that have sound samples stored on them.

Thanks.

The protos show took place on Sat/sun, nov 26,27 and one could see an interesting array of products around atari

Hardware:
on display were
-the medusa t 60
-the eagle

the eagle is now available; as it looks, its CPU will is being placed on a card that is easily interchangable to support other CPUs, at first, it will feature a 68030 card, which will be (at no extra cost) replaced by a 68040 card and later on by a 060 card. It will have an extremely fast bus system available with 8 slots minimum; it is fully TT downward compatible and coimprises all interfaces the TT has, except for DMA sound.
price at baout 4000 DM. GE soft is pl�anning also a low cost ST/TT clone at about 1000 DM.

the medusa t60 was up and running. It has specs similar to the medusa t40, yet it is 3 to four times faster than any existing 040 machine.

I couldn't see the afterburner040 and the barracuda040 on the show, but that should not say anything. Also not on display: the falconspeed486, which seems to have died quietly.

Progemtec, formerly Wilhelm electronik, has announced a range of new products for the atari line; though they were not at the show, they said on telephone, that they have two alternatives for increasing speed for atari computers ready for production. They have to chose between two alternatives. A solution, which includes inserting into existing atari hardware or a "more functional stand alone solution"; it would definitely involve a pci bus system

Software:
magic3 was up and running at several developers, such as No, Compo etc....; the macintosh version was also displayed and already sold. (ssome kind of public beta, as it seems....); apple were alsao there; their offer included performas with a free copy of magic.

other new products:
that's write 4, tempus word 2.90, papyrus gold in new version, ldw powercalc 3, a new viedeo software called "Neon", which was REALLY incredible, from comp Apex media, NVDi 3.01, Linux up and running with X11, Ease 3.5,......

Till then,

Alfred

Most software for DOS and even Windows assumes an 8088, and that's it.
Only OS/2, Windows NT, and the various UNIX varients (NEXTSTEP, Linux,
Solaris, SCO, etc) actually use a '386-or-higher the was it was designed
to be used, instead of as a fast 8088.

True, but your hardware still has some silly design compromises because
of DOS-compatibility. If you could buy a PCI-only non-DOS-compatible
Intel-based computer, it would be great, and probably expensive.

>or the TT video card.

Not sure what part of America you live in - but those are the most
outrageous prices I have seen anyone quote - ordering from someone
expensive no doubt.

Ram Adapter card on Falcon is $80-100 depending on vendor - why should
TT's be ~300? 16M of Ram 70ns can be had for $400-525. Why would
anyone pay $1280? My last external SCSI cd-rom (2x scsi2) cost $189.
Its a Texel and even when just introduced a little over a year ago
was only $500. So where are you shopping? I sure want to stay away
from there.

If all the prices are that inflated (guess I shaved about $1200 off
of the ~2200 so better than 50% reduction) then you can have the
system for <$3000. Wayne

4088. HELP: ST 1040 BOOT

Source record: 175803

Hi

I am not having too much luck with my Atari recently :(

Because I had to take my wonderful SM124 offline for repairs, I have to use an old RGB TV as a monitor all the time :(This monitor has worked fine as a medium and low rez screen for a long time.

When I boot the ST I now get a line of bombs or a grid of coloured squares. Sometimes I have to reset 4 or 5 times to get it to boot from the hard disk :(

Anyone know what is going on?

Ian_Taylor@a2w.maus.de TOS 1.4

4089. Atari ST games for sale, cheap

Newsgroup: comp.sys.atari.st
Date: 1994-11-28 18:53:51 UTC

Cross-posted to: misc.forsale,ca.forsale,fidonet.for-sale,comp.sys.atari.st

I have the following Atari ST programs for sale. They are all
original disks but, with exceptions noted, are parted from
their documentation (who reads it anyway?).

I pay postage at the prices shown to anywhere in the US.

The Black Cauldron: Sierra Software, Walt Disney, on 2 disks. $11.

Falcon: Spectrum Holobyte, on 4 disks, $15.

King's Quest: Sierra Software, 2 disks plus a 360 page book
"King's Quest Companion," all for $16.50 (The book by itself is cover
priced at $14.95)

King's Quest II: Sierra Software, 2 disks $11.

Flight Simulator II, 3 disks (2 are scenery disk) $13.

High Roller: Mindscape, 2 disks, $11.

Typing Tutor Word Invaders: Academy Software $7.50

--------the following programs are each on a single disk----

Dungeon Master: FTL Games, one disk and a 69 page book,
"Secrets of Dungeon Master" $10.

STWars: Miles Computing $7.50

Outrun: Sega $7.50

Hades Nebula: Gamebusters (requires color monitor) $7.50

Airball: Microdeal $7.50

Super Cycle: Epyx 7.50

MadLibs, World's Greatest Party Game: Price/Stern/Sloan $7.50

ALSO

PrintMaster Plus: Kyocera Unison Inc. $13.

] Can anyone tell me if there is an FTP site which has Stereo (or non-Stereo)
] MOD music files? I know this is a common Amiga format too, so should I be
] looking in the Amiga directories also (aaargghhh...)?

Get Octalyser (STE only) and find the 8-track MOD file "Jade".
You'll need at least 2meg of RAM to fit it into memory, but it sounds
really impressive! The MOD is on ftp.uni-kl.de in ./pub/atari/
somewhere. I got it from the /incoming/ directory some time ago,
so it would have been moved to the sound section now.

Some other good MOD's to look out for are:

Guitar Slinger
Space Debris
Gummisnoppis
Daley-88
Street Jungle
Celtic

They're the best ones I've got. Have a look in the amiga directories,
they'll be where the MOD files are at!

Hmm, I though TTiTT was an installment of the Leisure Suit Larry series, but
I'm not sure. LCP was intended to be educational entertainment software
for kids (the docs clearly state this). TTiTT is a graphical adventure of
some sort, right? If so, they are totally different.

> To change the subgect, that great Game (French) 'NORTH & SORTH' Infogrames,

4098. Mega-Depack v2.13/New Depack v1.00

Newsgroup: comp.sys.atari.st
Date: 1994-11-28 20:05:03 UTC
From: wells_s@ix.wcc.govt.nz
Message-ID: <3bdd5f$pf9@golem.wcc.govt.nz>
Source record: 175816

I've noticed "Mega Depack v2.13" appearing on several sites, don't bother getting it, as it's an old version, which was long ago replaced by "New Depack v1.00" by the same authors. The new version is more stable, multitasks properly, and recognises more pack-formats.

What they both are for those who don't know, are programs that will analyse any file, determine if it is packed or not, and if it recognises the pack-format (i.e. Which program was used, e.g. Ice Pack v2.4, PFX-pack etc.), it will attempt to depack it. Useful for programs like Ice-Pack which has no unpack function.

One of the best ways to enhance the STE is to get an ICD AdSpeedSTE 16mHz board. It will allow switching between 8mHz and 16mHz modes for compatablity. Cost is a bit over $100, if ICD still has any left. If not, Toad offers them for over $200 (!). I would assume you could get closer to the ICD price if you shopped around the various Atari mail order firms.

Whoops, you are across the pond, aren't you? Well, all bets are off as far as price goes, but it is still a great addition. I have a MegaSTE, and have been fairly successful in getting older games to work in 16mHz mode. Some games that were really bad on an 8mHz machine are great at 16mHz! Others are so fast as to be unplayable.

> sold my mono' monitor, it's not very practical anyway! :)

Hmmm, interesting. I use my GCR more than ever nowadays. My situation is a bit special in that I manage a bunch of networked Macs, many of which are still running System 6.0.8 due to the age of some Macs. Anyway, I still deal with System 6 a lot, and being able to run the stuff at home is great.

Even taking the System 7 domination into account, one can still purchase (new from discount houses, or used) lots of excellent software that is System 6 compatible, dirt cheap too. There are a number of firms that specialize in selling off old versions of stuff for really low prices. Finally, I have not really noticed a lot of things that won't work with System 6. Admittedly, I have not bought much new Mac software in the last year or so, but I am surprised that it has changed that much.

I heard there may be some code for the 1040st running around, perhaps of German origin, to magnify a portion of the screen. This is useful for folks who have poor vision. Any info on this would be appreciated.

Russel Martin

Hello,

I have just realized that I have an available PPP connection here
at school. I just went to a demonstration for Windows based PPP
connections. Does anyone know if PPP software exists for the
Atari (I have a TT)? I know there was a thread about this a while
ago but I ignored it because I didn't know I could use it.

Thanks for any info,

Sam

rm>
rm> Rod

This is a compile-time option for mint. In other words - you will have
to recompile the mint-kernel in order to get it. Just add -DFASTTEXT
to the makefile and recompile.
Then add the lines:

CON=u:\dev\fasttext
HARDSCROLL=24

to mint.cnf.

Make the HARDSCROLL variable the same as the # of lines on your
screen to get OK results.
(ST-HIGH/MED: 24
TT-MID/Falcon 640/480: 30
TT-HI: 60

Note; This will only gain speedup for TOS applications.

>price at baout 4000 DM. GE soft is pl&#65533;anning also a low cost ST/TT clone
>at about 1000 DM.

Now, that sounds interesting. I'm not quite up to date on DM/Sterling exchange
rate, but that does sound a more competitive price than the Medusa for
a comparable performance. A low cost clone doesn't really affect me though,
'coz I've got a falcon already.....

>the medusa t60 was up and running. It has specs similar to the medusa t40,
>yet it is 3 to four times faster than any existing 040 machine.

Now that is a proper fast machine. I believe (but cann't swear by it) that
you will find this is faster than any Apple machine at running 68000 binaries.
(Yes, I know native PPC apps are faster, but most software on PPC at the
moment runs under 68000 emulation, so this would be faster).

>I couldn't see the afterburner040 and the barracuda040 on the show, but

I actually saw a baracuda040 board at the Newcastle atari show last easter,
I cann't understand why they aren't actually selling them yet ?

>that should not say anything. Also not on display: the falconspeed486,
>which seems to have died quietly.

Not really surprising, it's probably as cheap to buy a low end PC as it
is to emulate one these days. And then you still get to use your Atari
while the PC chugs out the dull stuff.

>Progemtec, formerly Wilhelm electronik, has announced a range of new
>products for the atari line; though they were not at the show, they said
>on telephone, that they have two alternatives for increasing speed for
>atari computers ready for production. They have to chose between two

I hope a decent falcon accellerator will hit the UK real soon. I could
really do with something that gives me 32bit fast ram, and accelerates
the main mother board.

>
>Software:
>magic3 was up and running at several developers, such as No, Compo

Did it run on a falcon ? Magic looks great, but without f030 support
v2 was no good for me.

>etc....; the macintosh version was also displayed and already sold. (ssome
>kind of public beta, as it seems....); apple were alsao there; their offer
>included performas with a free copy of magic.

A fast mac running macMagic instead of MacOS is quite tempting as a cheap
way of getting a faster machine - watch the price of 680x0 macs tumble
as the PowerMac gets rolling.

>other new products:
>that's write 4, tempus word 2.90, papyrus gold in new version, ldw
>powercalc 3, a new viedeo software called "Neon", which was REALLY

4111. Need Printer Driver Help With AtariWorks

Newsgroup: comp.sys.atari.st
Date: 1994-11-28 22:09:06 UTC
From: rpool@iastate.edu
Message-ID: <3bdke2$6tt@news.iastate.edu>
Source record: 175824

I purchased AtariWorks off the net and have sucessfully installed it on my harddrive. The problem I have is that I cannot find a printer driver anywhere to work with it. Neither the install discs, the Works folder on the harddrive or the manual give a clue about drivers. I've tried an Epson LQ driver from Wordup in the ASSIGN.SYS file for Works but it just printed solid black bars. If you could give me anykind of assistance I'd greatly appreciate it.

>Oh, so you must be the first Falcon owner who's cpu operates at the same
>clock speed as my DX2 66.

Hmmm, easy to buy a accelerator to the falcon which clocks it to 40Mhz...
still You ONLY have 33Mhz on th bus in your DX2!

But agree, the Falcon doesn't run at the same speed as your DX2? 66

>Whoopee! My video card allows 64K colours at 1024*768 resolution

Yep... And HOW does it work? Swapping 64k of memory out to the Video card
:^D You NEED a DX2 66 to get that kind of output ;^D

>Why? What does your DSP do better than the soudblaster AWE32? You'll
>probably need to think about this for a while...

Well... badly choisen words... Havn't seen the AWE32 card... But the
16bit? cards that is out is SHIT! 8 bit AD-converters says it all...

How about the Falcons Oversampling... 256times!!! (No oversampling on a
soundblaster :^D)

Then WE have the DSP to add effects to the sound... And hey! we have DMA
for the sound _AND_ the SCSI... Remember, the CPU don't have to do much
on a Falcon when it comes to the sound, The CPU is free for other tasks!

Then we have the Price... a Falcon costs 300UKpounds... :^D

>Suit yourself! Personally I prefer a nice mechanical keyboard, freely
>usable away from the tower it's connected to.

Ever tried the Atari MEGA ST or TT keyboard... I must say I rather do the
(Very easy) hack to add one of those to my Falcon then use a Crappy
PC-keyboard!

>What a load of BOLLOX - I can't believe that you just turned a
>reasonable argument into a farcical blithering with your last statement.
>I spent nearly all my time on my Atari tweaking files left right and
>centre so as to make the damn thing work! Tweaking the .sys and .bat
>files of the PC is merely to make it work BETTER.

>Everything I ever did on my Atari required a large amount of fuss, and
>still bombed for no real reason half of the time.

Hmm... that is exactly the reason why I hate the PC's, but they don't
BOMB They give you a nice error message, like: Keyboard not present,

press F1 to continue. :^D

I can agree with people that a PC is more suitable for Heavy tasks... but not as a NICE homecomputer... or Music machine!

My ATARI's does what I want them too... This SUN Sparc do what I wan't it to... NO PC do what I wants todo... Easy choice!

>Steven

So why bother in this group, move to .atari.advocasy!

There is no "rscfind" call. There are shell_find and resource_load calls, I'm guessing you are talking about one of those. While NeoDesk does affect the way these calls work (part of how NeoDesk itself works), we don't know of any bugs in NeoDesk 3 or 4 as you describe. Maybe if you can give us a little more information. I'd also be very interested in what your friend wrote.

> yes, I fully agree! I do not see why atari users are too proud to admit
> that their machines can not compete with PC's. Comparing an ST with

Atari owners are proud <fullstop>. Back in the early 1980s we had a machine called the BBC micro in the UK. Its owners were like Atari owners. Convinced the machine was superior - in the face contradictory evidence that just wasn't going away.

In both cases - each machine *was* state of art when it was released. But machines never stay state of the art. I remember clearly in 1987 showing a BBC owner, my 520 STM. I had a SF354 floppy and a 12" Romanian B/W TV that was fuzzy. He was totally amazed though. I was just so fast and had *so* much memeory (512K). Up until that point he still believed BBC micros to be the market leader even though the spec hadn't really changed since 1981.

ST owners are in the same situation now. The machine is no *less* usefull than it was in 1986 which is why many people still find them adequate. However it has almost entirely expended its potential. Its not going anywhere. The average PC is so much better specified than almost all Ataris - and while certain Ataris have certain advantages over the PC, there is no universal reason to favour an Atari over a PC.

> I know, atari has a TT etc. sure. now look at
> how much a TT costs and compare it with a 486. Look at the amount
> of software for the TT and compare it with the amount of software
> for the 486. And still I would like a TT. You see, there is more to
> it than just speed/software etc. I just _like_ the atari computers,
> like the hardware etc. We all do. But don't close your eyes and dream
> that atari are the superior machines these days. It is just not true.

This paragraph above is just so true IMO. Another point about machines like the TT and Falcon is that they are exceptions. In the PC world the base spec is just so much higher than what the average Atari has (discounting things like the DSP for the moment). Atari software which requires a TT or Falcon has such a limeted market. However requiring a 486 and SVGA monitor on a PC is quite acceptable.

> BTW. IMHO there will never be a game like Doom on an atari (except
> the version for the jag, maybe). I heard a lot about this game and
> this weekend I got a copy for my 486. I was astonished about the
> graphics of this game. I had never seen anything like this. it is

I too got a copy for my 486 this weekend - though I had seen it being played a lot. True - its only a game, but I've never seen anything like that on my TT. Even if I could write a DOOM clone for the TT, why bother - how many

people have a TT and would be interested?

I think the main point comming out of all this PC talk is that its no longer a case of Atari or PC. If you stick with just an Atari you ostricise yourself from 90% of the current computer market. *However* just because you might now own a PC *doesn'* mean you are not still a dedicated Atari owner.

Roland.

From what I have been seing here, that this person has other problems, not to
do with Neodesk at all..

None of us here have any Problems with 'Two in One', as they say if you do
things wrong you end up with wrong results...

It is allways best to try with all those TSR's and ACC/CPX removed....

When you do have problem becarefull in what you blame....

From: rrice@netnews.upenn.edu
Message-ID: <3be2jj$70s@netnews.upenn.edu>
Source record: 175843

Many more thanks to all who have responded about my problems in getting the Omnibook 300 to link to my Mega 4 STE with GHOSTLINK.

I have tried all three serial ports, and gotten the same results, and I have disabled every auto program (including the HS serial driver patches and gotten the same results, which are--

1)A bad link (directory with SLAVE ERRORS) at 9,600 BPS, and no file transfers from the Omnibook. I get (TOS commands echoed)

Open File [File Name] Return 1
Find First [File Name] Return 0
Read 4096 Bytes [1] pos: 0 Return: 0

And then freeze city.

2)At 2400 bps or lower I get the same but then the rest of the file in increments until I get (at length) the whole thing.

I'd say it's the Omnibook, but I can't be sure there, either. Obviously there's a 4k buffer involved, but what appears to be happening are nasty protocol errors--on a null modem cable? With PROCOMM/STALKER I get 19,200 BPS with no errors.

Is there one so great of brain that he can solve two computer problems at one time?! No use looking here...

John Townsend has already tried to tell you guys; there isn't any more
computing development going on at Atari. He's very well connected there,
and left under the best of terms. Why do you insist on foistering these
rumors about another machine??

To add a little backup to John's comments, some months before I left Atari I
had a very long discussion with Jack Tramiel. There simply wasn't any
margins left in the hardware business. He felt that Atari would return to
the computer business in a few years with a unit based on the Jaguar. But
that unit would be at least two-three years down the road.

Atari is doing what they must do in order to stay in business. The Jaguar
is a wonderful product, and I'm confident that they'll sell boatloads of
them. And I'll still be using my Atari Computers on the homefront for a
long time to come...

regards to all,

Bob Brodie

Well, my 1040STe has now experienced failure of floppies (internal and external), printer and DMA port. I've tried replacing the sound chip, DMA chip, TOS, cpu, memory, and about every other thing that can be replaced, with no improvement. So, it's time to scrap it and minimize my loss. The following items are for sale at a fixed price:

1 meg simms (4 of them) - $25 each

720k DS/DD Epson floppy drive - $20

Power supply - $20

DEKA keyboard adapter and PC-clone style 101 key keyboard - $50

ST to multisync monitor adaptor cable - $15

For any other pieces, make an offer and I'll probably accept.
(No, it doesn't have TOS 2.06).

******************************************************
NEWS RELEASE: THE TORONTO ATARI FEDERATION PRESENTS.....ACE '95!!
******************************************************

There have been a few events that captured the imagination of
Atari Users over the years. One of the most significant of those
events was ATARI CANADIAN EXHIBITION '92 - better known as ACE '92.

Memories are long - especially about great successes!

ACE '92 was all of that and more. It provided unprecedented
opportunities for an enormous number of DEALERS, DEVELOPERS,
SHAREWARE authors and (most important of all!) ATARI USERS, to
gather in a venue which was bright, extremely busy, accessible
and interesting. ACE '92 was well organized, highly successful
and a profitable experience for everyone who participated.
```

We're doing it again!

ACE '95 IS COMING: ** April 1, 1995 - April 2, 1995 **

We have booked the North York Civic Centre, MEMORIAL HALL facility - 5,000 square feet in four rooms! The superb Civic Centre Complex features excellent highway access, high speed local route access as well as airport, bus, subway, car and truck access. In the main complex itself you'll find the NOVOTEL HOTEL, Civic Center SHOPPING MALL & an excellent FOOD COURT immediately adjacent to the Show Hall in addition to other RESTAURANTS and SERVICES. We're also located on Toronto's famous Yonge Street! The location features high traffic volume & a site central to several thousand Atari users from Toronto, Southern & Eastern Ontario, Quebec, Western New York, Pennsylvania, Ohio & Michigan!

The Main Auditorium (The Burgundy Room) is 2400 square feet of show/display floor, with a full sound system, proscenium stage, projection facilities, three entrances/exits, medium height ceiling (very intimate!), loads of electricity and direct access to the main foyer. The facility entrance is integrated with the Main Concourse traffic areas and prominently features a Canopied Main Entrance. The second hall (The Gold Room), is a 1,500 square foot room with direct access to the main foyer as well. The Gold Room has ample power, projection facilities, medium ceiling height and two entrances. The two smaller conference rooms are being slated for continuous LECTURES, DEMOS & WORKSHOPS throughout the weekend. The conference rooms also feature large picture windows, which provide loads of natural light (these are the same rooms which TAF uses for its regular teaching seminars!). We even have a dedicated MIDI room! The music people can *really* turn it up, without disturbing anybody! Show hours will be from 9 AM to 6 PM on Saturday April 1/95 and 9 AM to 5 PM Sunday April 2/95.

Every EXHIBITOR who attends will be supported by a large group of enthusiastic TAF VOLUNTEERS: for directions, support, banking, show liaison, etc. Transportation for Registered Exhibitors from the airport (Pearson International), will be provided free of charge (you must book this service in advance).

****

ACE '92 saw over two thousand visitors and this time around,

[Continued From Previous Message]

we know our visitors will be even more eager to shop for all the great products being offered, attend the SEMINARS & WORKSHOPS, see the very latest DEMOS of all the terrific new Atari SOFTWARE and HARDWARE and best of all.....have a terrific time!

****

FOR THE FIRST TIME EVER, we're presenting a THREE-TIERED RATE SCHEDULE. We know it will provide for greater participation by the smaller Shareware and Single Product Developers and User Groups. Show rates are as follows:

#A - DEALERS & DEVELOPERS, ONLINE SERVICE VENDORS & OTHER COMMERCIAL SUPPLIERS: *$350 Cdn/$230 US per booth, not including hotels and meals. This includes 8' x 10' booth, electricity, transportation from the airport/bus depot or train station, ACE Liaisons (during show hours for directions, services, services, show support, etc.), 3 display tables, 6 chairs, table skirts & partitions, discount hotel rate, setup and tear down help, access to the Hospitality Room. The ACE '95 Registered Exhibitor's Kit consists of a floor plan (showing your booth, parking and loading areas), City Map, directions, TAF brochure, pen, ID badge & the Toronto Tourist Pack. We will be mailing Kits to all Exhibitors, of course. You must pre-book your Booth(s). Attendance will be very high, and nobody arriving without a booking can be accommodated.

**Show management reserves the right to make a final determination as to who qualifies for this rate!

#B - SMALL DEVELOPERS & SHAREWARE AUTHORS: (*2 or FEWER products developed or marketed): $175 Cdn/$115 US per booth, not including hotels and meals. This includes a Half-Booth, electricity, table skirt and partition, transportation from the airport/bus depot or train station, ACE Liaisons (during show hours for directions, services, show support, etc.) 2 display tables (1-Std, 1-Sm), 4 chairs, discount hotel rate, setup and tear down help, access to the Hospitality Room. Registered Exhibitor's Kit (as above). We will be mailing Kits to all Exhibitors, of course. You must pre-book your Booth. Attendance will be very high, and nobody arriving without a booking can be accommodated.

*Show management reserves the right to make a final determination as to who qualifies for this rate!

#C - USER GROUPS - All User Groups are invited to bring their Disk Libraries, Newsletters and Membership Kits, etc., and set up in our new USER GROUP CENTER! It will be set up in the Main Foyer. The fee per User Group is *$55 Cdn/$35 US, not including hotels and meals. This includes a single table section at the Center, 3 chairs, table skirt, general liaison, access to the Hospitality Room, electricity, Registered Participants Kit (as above). We will be mailing Kits to all Exhibitor's, of course. You MUST pre-book your space in the User Group Center. Attendance will be very high, and nobody arriving without a booking can be accommodated. Please Note that used hardware and software (for sale or trade) is not permitted at ACE '95! We know the User Group Center will be perfect for exchanging ideas & practical solutions to fundraising, membership drives, newsletter production, library management, club account management, seminar & workshop planning, BBS networking, Sysop'ing, and much, much more.

*Show management reserves the right to make a final determination as to who qualifies for this rate!

****

AND MOST IMPORTANT OF ALL.....VISITORS - ATARI USERS.....THE BEST VISITORS OF ALL!!

****

VISITORS - Show tickets are only $6 per day or $10 for the entire weekend. Your Single Day or Weekend ticket will give you admission to the ENTIRE SHOW including, all LECTURES, SEMINARS & WORKSHOPS (1st come 1st served, of course), all DEMOS, & the Keynote Speaker. You may pre-book a room at the Novotel ($89 Cdn/$68 US per night - single *or* double occupancy). We have advance ticket forms available which include Hotel Booking forms; you must have a Visa, M/C or Amex card to book a hotel room. All Show Tickets are automatically entered in all the DOOR PRIZE and GRAND PRIZE Draws - extra Draw Tickets are only $2 each. For advance forms, call, write or E-Mail; see the addresses and numbers below! NO VISITORS RESERVATIONS ARE NECESSARY. Come as you are!!

We have a large, modern facility that is well equipped. We have a very large Volunteer base for Show Support. We have a large user base that is screaming for another ACE! We have inquiries coming from as far away as England, Germany, Taiwan and

: In <3bcjde$m1c@infa.central.susx.ac.uk> kaps3@central.susx.ac.uk (Steven Constantine) writes:

: >Oh, so you must be the first Falcon owner who's cpu operates at the same
: >clock speed as my DX2 66.

: Hmmm, easy to buy a accelerator to the falcon which clocks it to 40Mhz...
: still You ONLY have 33Mhz on th bus in your DX2!

How much does the upgrade cost?

: But agree, the Falcon doesn't run at the same speed as your DX2? 66

I can upgrade to a Pentium, selling my DX2 chip to offset the cost.
Works out to be a cheap upgrade.

: >Whoopee! My video card allows 64K colours at 1024*768 resolution

: Yep... And HOW does it work? Swapping 64k of memory out to the Video card
: :^D You NEED a DX2 66 to get that kind of output ;^D

So what, that whats I have, therefore i use 64K colours etc... What is
your point.

: >Why? What does your DSP do better than the soudblaster AWE32? You'll
: >probably need to think about this for a while...

: Well... badly choisen words... Havn't seen the AWE32 card... But the
: 16bit? cards that is out is SHIT! 8 bit AD-converters says it all...

The AWE32 is a major step forward from the old Sounblaster 16 (I have
this one) but it is hampered by a lot of software incompatibilities -
something like being to advanced for its own good!

: How about the Falcons Oversampling... 256times!!! (No oversampling on a
: soundblaster :^D)

: Then WE have the DSP to add effects to the sound... And hey! we have DMA
: for the sound _AND_ the SCSI... Remember, the CPU don't have to do much
: on a Falcon when it comes to the sound, The CPU is free for other tasks!

Wave Studio that comes with the SB16 seems to me to have more facilities
that I need. I can record CD D2D at 44KHz, 16bit stereo and save in
numerous formats - with .8Gb of drive space, no problem with room. By
the way, I have a PCI bus.

: Then we have the Price... a Falcon costs 300UKpounds... :^D

Ah, but who wants a 1Mb 0HD falcon - it's about as useful as chocalate
oven-gloves!

: >Suit yourself! Personally I prefer a nice mechanical keyboard, freely
: >usable away from the tower it's connected to.

: Ever tried the Atari MEGA ST or TT keyboard... I must say I rather do the
: (Very easy) hack to add one of those to my Falcon then use a Crappy
: PC-keyboard!

My PC keyboard is NOT crappy though - mechanical yes, but still with a
soft feel (sounds like a soap ad.). Having owned a number of home
computers in the past, and use a number at work here, I feel that the
keyboard I got 'lumbered' with is the best I've yet used.

: >What a load of BOLLOX - I can't believe that you just turned a
: >reasonable argument into a farcical blithering with your last statement.
: >I spent nearly all my time on my Atari tweaking files left right and
: >centre so as to make the damn thing work! Tweaking the .sys and .bat
: >files of the PC is merely to make it work BETTER.

: >Everything I ever did on my Atari required a large amount of fuss, and
: >still bombed for no real reason half of the time.

: Hmm... that is exactly the reason why I hate the PC's, but they don't
: BOMB They give you a nice error message, like: Keyboard not present,
: press F1 to continue. :^D

If you're dumb enough to use the machine without a keyboard then stick
to ZX81.

: I can agree with people that a PC is more suitable for Heavy tasks... but
: not as a NICE homecomputer... or Music machine!

I was very upset to have to get rid of my dearly loved STe - I'd had it
for 4yrs. Believe me, it doesn't take long to work up affection for a
new machine. PCs are not as impersonal as most people feel. I've seen
the grass on both sides - it's just as green.

: My ATARI's does what I want them too... This SUN Sparc do what I wan't it
: to... NO PC do what I wants todo... Easy choice!

Go buy a sun sparc then. I fail to believe that you see the Atari as;

1) a better games machine
2) a better WP machine
3) a better multitasking machine
4) a better mathematical machine.

i.e. if you can't get a PC do do the above, then you need to read a book
- like Peter & Jane.

Sure, music maybe the Falcon's forte, but don't try an pull the wool
over everyones' eyes that the PC can't manipulate music.

: So why bother in this group, move to .atari.advocasy!

It's about time this was done - who's up for it?

Surely Roland has the most unbiased opinion of all of us.

I like his last comment on the Obsolete Atari thread.

When I get the cash, my PC will have to move over a little and share the
desk with an STe!

Regards,

Steven

4139. starball on TT

Newsgroup: comp.sys.atari.st
Date: 1994-11-29 12:07:36 UTC
From: meulenbr@prl.philips.nl
Message-ID: <meulenbr.786110856@cstw168>
Source record: 175702

Triggered by the recent messages on starball, I decided to check it out.
It looks interesting, but unfortunately on my TT the screen turns black
after a short while (often the initial screen does not even show up).

Has anyone an idea how to fix this? If it matters: I'm using TOS 3.06

YOu ARE MISSING THE POINT!

Cover disk is the commercial equivalent of shareware. You get to try the
software without forking out loads of money for the privilige. At the
same time, you are not really getting something for nothing. There will
always be those who will settle for the limited version or the older
version, but hey, that's the way the cookiek....blah blah....

Simple as that. Whether you buy the rest of the package through the
magazine offer or through another source, that's upto the person concerned.

Regards,

Steve

: Whether MS-Windows looks better than GEM is IMHO a matter of taste.
: Personally, I prefer GEM with a decent shell (i.e. Gemini 2) although
: it lacks some features of Windows (i.e. iconifying of windows). But
: I think GEM usage is much more intuitive (since it's much more Mac-like).
: GEM seems also more user-friendly to me than X-Windows.

My favourite bit about GEM/Atari etc is the high res large colour base.
Hang on, that's Windows. Sorry!

Come on, Windows has a little more over GEM than just window
iconification.

: One of the problems with GEM is that there are no real guidelines by
: Atari for the user interface. Something like Apple Human Interface
: Guidelines is missing. (There are some "de facto" standards created
: by the Atari user community, I know. It's a shame that many programmers
: don't stick to these standards.)

If this happens, could someone who has the knowledge build a "plug and pray"-
package out of Linux and X. If I get a christmas present which has installation
that is almost impossible to accomplish without a degree in computer sciences,
the joy of getting a new toy is surely gone.

I mean: if someone has a successful installation, he could do a package out of
it which I then could just put under to e.g. E:\LINUX\.

Is this possible?

Roland Givan (rgivan@cix.compulink.co.uk) wrote:
: Atari owners are proud <fullstop>. Back in the early 1980s we had a machine
: called the BBC micro in the UK. Its owners were like Atari owners. Convinced
: the machine was superior - in the face contradictory evidence that just
: wasn't going away.

: In both cases - each machine *was* state of art when it was released. But
: machines never stay state of the art. I remember clearly in 1987 showing
: a BBC owner, my 520 STM. I had a SF354 floppy and a 12" Romanian B/W TV
: that was fuzzy. He was totally amazed though. I was just so fast and had
: *so* much memeory (512K). Up until that point he still believed BBC micros
: to be the market leader even though the spec hadn't really changed since
: 1981.

I have to plead guilty, myself, to being amazed by the 520 STFM (which I
bought), even though I owned an 'amazing' BBC Micro model B (32K RAM).
I think I bought the BBC back in 1982, and the Atari in 1987.

HOWEVER....don't forget that Acorn (the makers of the BBC Micro) built
the FIRST home computer based on RISC technology in 1987 (or so). Saying
that, I didn't buy one since I'd already bought an Atari.

Last year I bought myself an Acorn A5000 (again RISC technology) and
it is a really amazing machine - yep even more so than the good old
520 STFM. It's now been superseded by the Acorn Risc PC, an even
more amazing machine.

You just can't keep up these days...

4152. Probs with TeraDesk (#2)

Newsgroup: comp.sys.atari.st
Date: 1994-11-29 15:20:02 UTC
From: swhatley@blkbox.com
Message-ID: <3bfgr2$coh@news.blkbox.com>
Source record: 175925

Seaking of problems with TeraDesk 1.40, I get an error (or worning) message when I exit some programs. the message is "This is not a GEMDOS program." Two of the programs which do this is Flash 1.6 and TOSWin. When I run Flash form the normal GEM desktop, I get the normal Flash logo when it starts up but, when I use TeraDesk, I don't get the logo. In fact, it immediately puts me in the execute .DO macro file selector.

In order to do Zmodem, I normally start 'sz' on the host while in Flash. Then I exit Flash, go to the desired directory, and then click the 'rz' icon on my desktop. It now seems the the GEMDOS error message is sending an 'exit' signal through the modem port which causes 'sz' on the host to terminate before I can run my 'rz'.

Finally, it seems that TeraDesk sometimes sends error messages to the modem buffer instead of to the screen, I notice that when I ran ZOO.TTP with the wrong parameters, the error text appeared on my screen when I ran Flash.

I have noticed these problems since TeraDesk v1.39. I had previously used version 1.35. I have a Mega 4 ST with TOS 1.02.

Thanks,
Steven Whatley

In article <3be59d$dih@nntp.crl.com> bob@goldleaf.com (Bob Brodie) writes:

>John Townsend has already tried to tell you guys; there isn't any more
>computing development going on at Atari. He's very well connected there,
>and left under the best of terms. Why do you insist on foistering these
>rumors about another machine??

OK, guys... here's your chance to flame Bob Brodie as an anti-Atari radical and to oust him from the fold of the true believers.

C'mon, there is nothing wrong with facing the truth concerning the business situation at Atari. In fact, now is the time that Atari users can help each other the most as the level of support dwindles.

If you choose to move on to another platform for whatever reason, then more power to ya. It's been fun. Good luck.

If you choose to keep using your Atari until Hades freezes over, that's cool too. Whatever works for you. It's NOT a competition, gang.

Remember... whoever dies with the most toys... still dies (not wins).

Enjoy life, dudes (and dudettes). :)

-Hutch- @ Fair Dinkum Tech

P.S.: And thanks go to the Brodiemeister for the 'sanity check.'

4157. Re: Atari 800xl emulators?? exists or what?

You should look into PC-Xformer by Darek Michoka of GEMulator fame.
Judging from the buzz in comp.sys.atari.8bit (where you should ask for
more info) it seems to work very well. Darek actively supports this
product, too. You can email him at darekm@microsoft.com for more
specific info.

I'm looking for a program that will convert pictures, especially scanned clip art, into ASCII pictures. I know there are some about but don't know where.

Can anyone point me in the right direction?

Thanks.

Andy.

Check in comp.sys.computer.handheld (or something like that) and
post a 'Want To Buy' notice. And of course try the more common
trading newsgroups such as misc.forsale.computers.other, et. al.

4163. v08INF4: Introduction to comp.sources.atari.st

Newsgroup: comp.sys.atari.st
Date: 1994-11-29 16:30:13 UTC
From: avg@cwi.nl
Message-ID: <D01F6D.1JJ@cwi.nl>
Source record: 175927
Cross-posted to: comp.sources.atari.st,comp.sys.atari.st

Submitted-by: avg@cwi.nl (Annius Groenink)
Posting-number: Volume 8, Info 4

This article is posted twice a month. It gives a short
introduction to comp.sources.atari.st and describes how to submit
sources or digressions to the group.

I am always looking for suggestions on how to improve the usefulness of
the newsgroup, and can be contacted at the following internet address:

avg@cwi.nl

Annius Groenink, Moderator.

ABOUT comp.sources.atari.st

The moderated usenet group comp.sources.atari.st contains publications
or announcements of sources and texts about programming for Atari TOS
computers. The publications on comp.sources.atari.st may be freely
distributed as long as modifications are documented and the original
authors are mentioned.

THIS IS A MODERATED GROUP. YOU CANNOT POST TO IT BY YOURSELF. Read the
instructions below for submitting material intended for publication on
comp.sources.atari.st.

SUBMITTING SOURCES OR DIGRESSIONS FOR PUBLICATION

Items intended for posting or queries and problem notes should be sent
to avg@cwi.nl. If you are on a UUCP-only site, you can send them to
uunet!cwi.nl!avg.

If you want verification of arrival, say so at the beginning of your
submission, or in a cover note. I try to verify that a program works,
and if I can't get it to work, I may hold up posting it for a couple of
days. Please note that, except in rare cases, software without
documentation will not be published. The backlog from receipt to posting
varies from one to four weeks depending mostly on the set of submissions
currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two
separately. If I have to separate your sources from your binaries by
hand, your submission will most likely sit on the back burner for a

while, or be rejected outright.

Sources can be submitted in ASCII form, but for large pacages, a ZOO 2.1 archive encoded using Dumas uuencode is preferred.

Please include a description of your program at the top of your article. Look at old issues of comp.binaries.atari.st for examples of the sorts of descriptions I'm looking for. In general you should indicate what the program does, on what types of Atari TOS computers, whether your program requires a certain amount of on-board memory, a hard disk or a certain screen resolution. If necessary, I may rewrite or add to this information in order to make the postings to the group more uniform. I can't check your submission in all possible configurations, and see what works and what doesn't. Without a description, your submission is likely to be rejected.

THE STRUCTURE OF COMP.SOURCES.ATARI.ST ARTICLES

There are two types of articles in comp.binaries.atari.st: "information postings" and "sources". The source postings are also called "Issues". For a while, 'announcements' were also accepted, but there is now a dedicated group, comp.sys.atari.announce, for that purpose. The type of a posting can be distinguished by the subject line:

Subject: v02INF1: Introduction to comp.sources.atari.st

This first word in the title identifies this as the first info posting of volume two. Similarly, the subject line shown below:

Subject: v06i081: godsrc -- Universe simulator

identifies this as the 81st source article in Volume 6. Large sources are broken up into smaller pieces, and have subject lines that look like this:

Subject: v06i088: decbustr -- VMS clone in ST-LOGO, Part03/08

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: MWC, Megamax, 1meg, high

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self- explanatory.

Alcyon - Alcyon C (included with Atari developer's kit)
MWC - Mark Williams C
Megamax - Megamax C
Laser - Laser C
Lattice - Lattice C
C - Any C compiler

OSS - OSS Personal Pascal
BASIC - ST BASIC (this is not a joke!)
uuencode - program is uuencoded (uudecode required to unpack)
arc - program is archived (arc required to unpack)
zoo-high - program is archived (Zoo 2.1 required to unpack)
lharc - program is archived (lharc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: david@bdt.UUCP (David Beckmeyer)
Posting-number: Volume 6, Issue 80
Archive-name: micro-rtx

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

REPORTING AND TRACKING BUGS AND PATCHES TO POSTINGS

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the sources I moderate, so don't send your bug reports to me.

HOW TO OBTAIN OLD ISSUES

There is currently no officially documented archive for this group.

The following is a hucksterish plug for Toad Computers Holiday Festival '94 which will take place this coming weekend at Toad Computers in Severna Park, Maryland. If you are unable to attend or are not interested in reading about the show, please feel free to skip this article. Thanks -- from the folks at Toad Computers.

TOAD COMPUTERS -- HOLIDAY FESTIVAL '94! -- DEC 3 & 4, 1994
==========

== THE SHOW IS APPROACHING FAST! ==

IF YOU'RE LOOKING FOR ATARI EXCITEMENT, DON'T MISS
TOAD COMPUTERS HOLIDAY FESTIVAL 1994!

The show will take place at TOAD COMPUTERS in the Park Plaza Shopping Center in Severna Park, Maryland. There's unlimited free parking and lots to see and do nearby, as we're nestled between Washington, Baltimore, and Annapolis (eat the great local seafood!).

Confirmed 1994 attendees include:

- Tom Harker, ICD Inc. (CatBox and Star Battle)
- Roger Burrows, Anodyne Software (ExtenDOS CD Driver)
- Gribnif Software -- Dan Wilga / Rick Flashman
- Wizztronics (Falcon enhancements & more)
- Bob Luneski, Oregon Research
- Jim Fouch, Fouch Software (Mailing Manager ST)
- MajicSoft
- Binary Sounds (Hybrid Arts Product Line)
- Joe Waters, Ed. of Current Notes
- Greg Ondo, Steinberg Jones
- Charles Smeton (STraight FAX!)
- And of course, the Toad Gang -- including
Dave and Jennifer Troy

ATARI ST / TT / Falcon, Jaguar, Lynx, Portfolio and 8-Bit!!
Come SEE IT ALL at the nation's premier ATARI Outlet!

TOAD COMPUTERS HOLIDAY FESTIVAL '94:

Saturday December 3rd 10:00am - 7:00pm
Sunday December 4th 10:00am - 5:00pm

Toad Computers

TOADFAX: (410) 544-0098

For MAPS, DIRECTIONS, HOTEL ACCOMODATIONS, or any other
information you may need, please call us!

The local HOLIDAY INN is offering $59 (reg $90) rooms for the
show. For more information, please call us at (410) 544-6943!

LOTS OF FOLKS KNOW ABOUT THE SHOW:

- 5000 Postcards Mailed in mid-November
- Featured on the back of our latest catalog
- Advertised in Current Notes & ST Informer
- Advertised Electronically (Internet et al)
- Highway Signage

SPECIAL ICD PROMOTION:

ICD is offering a special promotion at the show. Buy an
AdSpeed ST/STE for $159 _INSTALLED_. The board will be
installed & your computer shipped back to you FREE or,
time permitting, the board can be installed at the show --
ABSOLUTELY FREE!

This is a great opportunity to get your ST going faster
and save a little CASH! Bring your machine to the show
to take advantage of this great deal!

A SAMPLING OF WHAT WE'LL HAVE FOR THE SHOW:

- Falcon030's (LOW!) - Hard Drives
- TT030's - Hand Scanners
- 1040STE's - 450 Mice
- Stacy's - 125 Trackballs
- Mega STE's - Joysticks
- Laser Printers - ALL NEW SOFTWARE
- CD ROM Drives - STraight FAX! (Show Special)
- Monitors - Disks
- Power Strips - Mousepads
- Books - 8-Bit Hardware
- ST Hardware - Games
- DTP Software - Printers
- Multimedia Speakers - Internet Demos
- Lynx / Lynx Games - Jaguar
- NEW JAGUAR TITLES! - Codehead Stuff
- Printer Ribbons - FAX Modems

- Great deals on all hardware and software
- Full selection of Atari hardware & software
- Atari Falcon030 Computer Systems at Special Discount Prices

- Super Low Clearance Prices on a wide range of items
including discontinued hardware and software, store demo
equipment, and much more!
- Our Toadally Cool Dog, Zoe

- Free Hot Apple Cider (and cookies if you're good!)
- Special "Kid Korral" with fun stuff, like crayons
- Dave Small's Own "Live Rust" Neil Young Album,
The One To Which Spectre was Programmed!
- Demos of hardware and software!
- NETWORKED JAGUARS!

=== MUCH, MUCH, MORE! ===

OTHER COOL STUFF WHICH IS ON ITS WAY TO US (As We Speak):

- Over 14,000 ST Games
- ImageCopy 3.5CD (Supports Photo CD Pictures)
- NVDI 3.0 (New Version)
- MagiC (Newest Version)
- Desktopper (Falcon Case)

STUFF WE'RE GIVING AWAY:

- Jaguar System (Raffle to Benefit Habitat for Humanity)
- Jaguar T-Shirts, Mugs & Bumper Stickers
- Codehead T-Shirts
- Free Toad T-Shirts to First 25 Attendees
- Games
- Lots more!

How much would you pay to be a part of a celebration like this? $3.98?
$14.59? $75.00 Non Refundable? Well, no need! Admission to TOAD
COMPUTERS HOLIDAY FESTIVAL '94 is ABSOLUTELY FREE!

In the immediate area is historic and scenic Annapolis! Annapolis had
been the capitol of the thirteen colonies under the Articles of the
Confederation. Its historic state house is the oldest in use in this
country and its white dome was built without the use of nails.
Annapolis has a truly quirky personality that is a combination of
southern hospitality, northern charm and historic clout. For you
military buffs, Annapolis is the home of the United States Naval
Academy. It is open to the public and features several museums,
exhibits, and historical buildings. Annapolis is also home to some of
the best seafood in the world, straight from the Chesapeake Bay.

Toad Computers is TEN MINUTES away from downtown Annapolis.

Also nearby is Baltimore, home of the recently renovated and world
famous Inner Harbor -- a huge shopping and eating fiasco that's
just minutes from some of the city's most historic sites. In the
inner harbor area, you can visit the National Aquarium (home to
thousands of species of marine life) which also features a working

rainforest in its pyramid shaped dome. Visit the Maryland Science Center, home to a huge I-MAX theater and also packed with hundreds of constantly changing exhibits that relate to science, computers, and more. Visit the home of Babe Ruth, Betsy Ross, or Edgar Allan Poe. See the new stadium for the Baltimore Orioles -- Oriole Park at Camden Yards. You might also want to visit Fort McHenry -- the rampart that still stood after a night of bombardment in 1812 that led Francis Scott Key to write our national anthem to the tune of an old drinking song. Find out why this happened! Visit the B&O Railroad Museum where you can learn about the story of the rise and fall of the greatest form of transportation this country has ever known.

Toad Computers is THIRTY MINUTES away from downtown Baltimore.

Lastly, you may want to make a stop in Washington DC -- murder capital of the world and Capitol of the United States. Where else can the mayor of a city smoke crack and get RE-ELECTED? Come see the White House -- maybe you can visit Bill Clinton at home and give him your ideas for healthcare reform (yeah, like we're gonna see that anytime soon). Visit the Smithsonian Institute, National Art Gallery, countless memorials (Iwo Jima, Viet Nam, Jefferson, Lincoln, Washington Monument), and more. There is more to do in Washington than I could ever begin to list here with any justice. If you do want to go to Washington, check with AAA to make sure that you're not missing anything. It is truly a city with something for everyone.

Toad Computers is FORTY FIVE MINUTES away from downtown Washington.

HOTEL ACCOMODATIONS

If you plan to visit the Annapolis area from out of state, there are several hotels in the area that we may recommend:

Sheraton At BWI Airport 15 Minutes Away
(410) 859-3300 On Airport Grounds

Loews Annapolis Hotel 15 Minutes Away
126 West Street Downtown
Annapolis, MD 21401 AAA 4 Diamond Rating
(410) 263-7777 Somewhat Expensive

Days Inn 10 Minutes Away
1542 Whitehall Road Next to Outlet Mall
Annapolis, MD 21401 on U.S. Route 50
(410) 974-4440 Near Bay Bridge

** Holiday Inn 15 Minutes Away
** 6600 Ritchie Highway On Ritchie Highway
** Glen Burnie, MD 21061 (MD Route 2)
** (410) 761-8300 SPECIAL $59 RATE!

Historic Inns of Annapolis For you lovebirds who
(There are several) are just dying to
Church Circle have a romantic time
Annapolis, MD 21401 in the "ancient city."
(410) 263-2641 15 Minutes Away

For more information, please call Toad Computers at
(410) 544-6943.

==========

OK! So you're coming! TERRIFIC! Here's everything you need to know:

When: Saturday, December 3rd 1994 10:00am - 7:00pm
Sunday, December 4th 1994 10:00am - 5:00pm

Where: Toad Computers
Park Plaza Shopping Center
570 Ritchie Highway
Severna Park, MD 21146

So come see the Jaguar, see Falcons in flight, see Toad Computers (America's Atari Source and the only Atari Superstore), see the local attractions and have fun. And help us ring in the holiday season! We look forward to seeing you!

HOW TO GET HERE:

For a map to Toad Computers and the immediate area, see GEnie ST Roundtable file #25969 (PostScript) or #25970 (Img Format). Or just call and we'll FAX or mail it to you. (This is also available on TOADFAX!, our FAX-on-demand service.)

Come Visit! We're Expecting You!

From Annapolis: Cross Severn River using US 50 bridge (east).
Take MD 2 north (first exit across bridge).
Turn left at sixth traffic light (McKinsey
Road). Turn right immediately into Park Plaza
shopping center.

From Baltimore: Take I-695 (Baltimore Beltway) south to MD
route 10 (to Severna Park). MD 10 will
intersect with MD route 2 south. Take route 2
about 3 miles further. Turn right at sixth
traffic light, onto McKinsey Road, then
immediately right into Park Plaza shopping
center.

From Washington: Take US 50 (begins as New York Avenue) east to
Annapolis. Follow directions from Annapolis.

From Columbia: Take MD 32 east to I-97 north (to Baltimore).
Exit onto Benfield Boulevard towards Severna
Park. Follow Benfield Road to Robinson Road to

MD 2. Turn right onto MD 2; second light on
right is McKinsey Road. Then turn right
immediately into Park Plaza shopping center.

Once Inside
Park Plaza: Locate and face Jo-Ann Fabrics. Turn left and
proceed about 200 feet. We are on your left,
across from the Signet Bank drive-through
island.

The street address is 570 Ritchie Highway. If you need any further
assistance, please feel free to call us at (410) 544-6943!

We hope to see you here! Last year, we were really happy with how
things went. The holiday season is a really wonderful time to get
together with Atari folks and it adds a spirit of real levity and
excitement that is often missing at other Atari events. We're looking
forward to putting on a first-class show, and we hope you can join
us.

4166. Seeking English documentation for AV protocol

Newsgroup: comp.sys.atari.st
Date: 1994-11-29 16:54:43 UTC
From: rflashma@mhc.mtholyoke.edu
Message-ID: <rflashma-2911941154430001@flash.comm.mtholyoke.edu>
Source record: 175928

A couple people have been asked us to support the AV protocol (actually--two people on this newsgroup). Therefore, we are looking for English documentation for it. Atari has not heard of this protocol, so we are not able to use official channels to get information on it.

Recently we were sent what was supposed to be English documentation, but after a brief English intro, all the C and H files were still in German. Is there any available English translation of this protocol?

Any help would be appreciated.

4167. 040 Board for Falcon?

Newsgroup: comp.sys.atari.st
Date: 1994-11-29 17:05:00 UTC
From: christian.mittendorf@space.ct.se
Message-ID: <0af6716f@ct.se>
Source record: 175769

Hi!

In the november issue of german ST-Magazin (Page 14) a 68040 accelerator board for the Falcon is said to be shown on the proTOS-Show last weekend. The board is manufactured by an american company called "best electronics". Does anybody have information about this board? Was that board on the show or does it have the same problems(?) as the Afterburner?

And what is the Afterburner doing? Last spring I ordered information from Overscan/Berlin and for 2 or 3 month I got lots of papers about all their products - but no information about my main interest. Then the papers stopped and even the advertising was stopped. Some rumours (?) said that the Afterburner was sent to Sunnyvale to be checked by ATARI. That was the last information I got. Are there any new information?

Could we Falcon owners speed up our beloved bird by an accelerator board to 040 or do we have get a Medusa?

Greetings,
Christian

I rather think that was the whole point. From other msgs, it is alleged that Mr Chung _stopped_ the check. Whatever, if it just bounced because he had no money in his account, or if he stopped it, the least he could have done was to e-mail Mr Bates with an explanation. It is reasonable to presume that he never did this, otherwise there would be no reason for Mr Bates to post the msg he did. I sympathise with Mr Chung if it was an accident, but whatever, an quick e-mail explanation would have avoided all of this.

If *you* wouldn't do that for me, then I certainly wouldn't buy from _you_ !

] do with Neodesk at all..
]
]
] None of us here have any Problems with 'Two in One', as they say if you do
] things wrong you end up with wrong results...

An older version of 2in1, and Neodesk v3.03 DID have problems. I'm
unsure as to if the latest 2in1 has problems with any Neodesk, or
the latest Neodesk has any problems with 2in1. I've got no use for
archive shells, all I do i double click, so I don't bother trying! :)

The one I did try a few months ago with Neodesk 3 however, did produce
the same problem as is being described...

Hi gamers!

I do like to play war strategy games, it is much more
environmentally friendly than the real thing.

The best ones I have found for the ST are: Empire, Colonial Conquest
and recently World Conquest.

An old ST Format gave 92% to game called "War in the Gulf", has anyone
played this?, is it a war game?, would you give it 92% ?

Source record: 175767

Hell, if this isn't going to move to advocacy, I may as well join in
the fun....

Opinions Please... (that's asking for trouble isn't it ! :-)).....

I am an Atari Owner..STFM, Mono, HD, etc etc. My sole reason for buying
the ST in the first place was to do MIDI sequencing. I don't do a lot of
it these days, but would like to keep the facility in case I ever get back
into it. I have a fair amount of games (mostly rather old), and a lot of
MIDI software. BUT....I'm thinking about moving to a PC. ARRRGHHHH !

I know that my ST has better designed guts than any PC, surely it is what
happens at the user interface that counts most. I'm using the PC in the
office right now, and it *does* irritate me that this box could run much
faster if it wasn't the patchwork of kludges that it is, *but* it doesn't
bomb out on me, I have _very_ rarely had it crash at all, unlike my ST.
I have colour VGA, a nicer (IMHO) keyboard, and after using Procomm Plus
and, well, all other PC apps I've tried, they make my ST seem, well, a
poor second. BUT, it *really* bugs me that I'm using a poorly designed
system that is crippled by a stupid OS. I feel happier that the ST is
whizzing all its bits about with clean efficiency, but it doesn't give
me what the office PC can. I also doubt if a PC could handle the MIDI
stuff with anywhere near the required skill of my ST.

Oh woe is me, I cannot decide. I want both, the ST to do the MIDI and a
PC to do most of the rest, but I cannot afford both. Something's got to
go. Should I sell the ST & get a PC, or keep the ST and wait for a system
that isn't crippled to come out ?

BTW, I see everyone here ripping into each other over the PC v ST thing.
The ST *has* passed it's heyday, and the PC *is* one big kludge we've had
forced on us as 'the standard' [remember the Betamax v VHS thing ?].
Surely we would *all* be better off attacking the manufacturers and
demanding a new system that *works* clean and fast. All this in-fighting
is only going to let them [the manufacturers] get away with it again.
(so, you can tell I'm a union man...:-))

Yes, that's the one.

> Well the way it runs on my 16mhz Mega ST, I thought I had forgot to turn
> the Computer on...

I think this is exaggerating, just a _little_ bit!

> Its like running a Program on a 500khz machine, far to slow, may be OK for
> those with small 30meg hard drives..

Well, I use it to scan about 600 megs of hard disk space, from time to
time, and find it reasonably fast (as long as you're not scanning for
text _inside_ the files). Even when I'm using my 8 MHz system.

> Just wait untill Danny places Jetfind on Hensa, it will blow you away....

Actually, I have seen JetFind, and it didn't blow me away. Unlike
STree, with JetFind you can't _do_ anything with the files you've
found. No copy/move/delete/rename/view/print. So it's less useful
for me. YMMV. JetFind is also not _that_ much faster than STree,
either. About 30%, if I recall my benchmarks correctly. This was
version 1.3 something IIRC, so it may have improved.

Note that I'm not knocking JetFind. It's well done (although limited
in a number of respects), and very fast. It's been a while since I
was playing with my batch of file finders, but as I recall, JetFind
was about the fastest of the bunch (approaching the theoretical limit
of how fast the directory tree could be searched). I think the only
one I found that was faster was a prototype I developed in-house at
Paradigm (roughly twice as fast as JetFind).

A deficiency that both share (hopefully Ewout's will be better) is
that once you start a search, you're locked out, with very little
useful feedback. Neither shows you how many matches have been
found, or a list of the matches, until they finish. And you can't

stop them part way through if you realize you've specified a wider
(or incorrect) search than you'd prefer. File finders on the Mac
are _way_ better in this regard.

You need to add an include directive to your source code {$i PasTrix}
and depending on whther the PasTrix routines reside in a separate lib-
rary, you'll need to add that library to the link list, in the Link
options menu in the Pascal shell.

> (I work with ST Pascal Plus ver2, quite old, I know, but where is something
> new???)

Nope. v2.05 in the U.S. and U.K., and v2.08 in Germany was the last
release.

> Besides, I'd Like to know if there is a Borland-compatible Compiler
> for the ST.

Yes, there are two of them: HighSpeed (Maxon) Pascal (developed by
D-House), and Pure Pascal (by ASH). HighSpeed is (mostly) Turbo 5.0
compatible, and Pure is reputed to be TP7 compatible. HighSpeed lacks
OOP, procedure parameters, and expressions in constant declarations,
but is a pretty nice (and inexpensive) environment overall.

With the advent of MiNT 1.12 (and figuring out that this version is actually quite usable and stable) I have decided to try and install Minix. So far I have it loaded, only on drive A: for experimentation purposes. I use TCSH, but when I do a listing on the Minix drive it only show the standard atari 8 character and 3 extender filenames. Is there a way to get TCSH to show the extended filenames? Perhaps I am missing something. Any help would be appreciated. Once I get this solved I plan to tackle MiNTnet.

> a little on the low side ;-)

Evidently the pricing is pretty good here. I just bought a triple-speed CD-ROM unit (a Toshiba XM-5201), with 510 KB/s transfer rate, 150 mS avg seek, 25 mS rotational latency, tray-loading (motorized in and out), in an enclosure with a power supply, cables, manuals, (mac) driver software, terminator, etc., for $199 U.S. total, plus $3 for overnight delivery.

So my price was actually a little on the _high_ side! :-)

- Mark

P.S. The audio section has a headphone jack on the front and RCA jacks on the back, with x4 oversampling and digital filtering. It sounds pretty good. ;-)

P.P.S. This was from MacWarehouse, by the way. Item #BND-0507 at 1-800-255-6227. I don't know if they accept international orders. I'll check...

Yep, they do. Although it's bound to be extra for shipping. Their international number is 1-908-370-4779, and they accept credit cards. You'll also need a 50-50 SCSI daisy chain cable (I did), unless you're connecting to a TT, which has the Mac-style DB25 connector.

Well, actually, it's not a "grep" program. Grep stands for "Globally search for Regular Expressions and Print", and scans for text contained inside a file. JetFind doesn't do this, unless I missed it behind one of those German-labelled buttons. :-)

> It also runs as a PRG, and its Fast Real Fast...!!!!!!

Yes, although it can also run as a DA, it's nice not to have to tie up a slot or the memory, if you only need it once in a while. STree only runs as an accessory.

I have a big box of software I need to get rid of to a good home. The Box contains many titles (around 25, I think) including Civilization, Populous, F-16 Falcon, Nitro, etc... It also contains some hardware such as joysticks, Synchro Express disk copy cartridge, a 1200 baud modem, etc... I will take the first $55.00 for this box.

I also have a standard Atari color monitor with a dark screen (JVC?). It worked perfectly when I last unhooked it and had very good color. I would like to get $100.00 plus shipping for this.

If you have any questions or want more details, please e-mail me as I don't get onto this group very often.

> HOWEVER....don't forget that Acorn (the makers of the BBC Micro) built
> the FIRST home computer based on RISC technology in 1987 (or so).
> Saying that, I didn't buy one since I'd already bought an Atari.

Yes Acorn got their act together in the late 80s after treading water for far too long. Because they had sown up the educational market in the UK they believed they could get away with 'new' machines like the BBC B+ (BBC B with 64K). The BBC Master series was much like the MSTE ('too little, too late), but the Archimedies were great.

Atari OTOH have onlt made one real stab at the home market after the ST. This being the Falcon. The STE was about as advanced as the BBC B+ was compared to the BBC B. The MSTE never shipped in any real quantity (though there are a lot in this conference) and the TT was just plain too expensive.

Having said that though Acorn have had to fight *very* hard for their tiny market share. If they weren't bailed out firstly by the UK educational establishment and secondly by Olivetti (who now own them IIRC), they would be long gone.

By this logic Atari should be long gone - but somehow they hang on. It not doing us much good though.

:-(

~ The Independent Magazine for users of the Calamus DTP Package ~

IT'S HERE

If you are a user of the Calamus DTP package you will undoubtedly be interested to learn of the arrival of an Independent Magazine totally dedicated to this "Great Professional" Desktop Publishing Program. This Magazine is available on a quarterly basis, in an A4 mono format with a minimum of 14 pages per issue.

AIMS

The aim of this magazine is to help you, the user to gain the most from your investment. CALAMUS USER will act as a platform for users to help to offer others and exchange ideas. Whilst keeping you informed of the latest events in the Calamus and DTP world.

HOT NEWS

News Desk will contain the most relavent and up to date information on product announcements within the DTP world to keep you abreast of this fast moving market.

IN-DEPTH REVIEWS

Each issue has an indepth review on a forthcoming, new or existing product that will enhance the use of Calamus. Many reviews will be written by experienced users who rely on the best products for their livelihood.

TECHNICAL TIPS

Technical tips will tell you what the manuals don't. This will be done by experienced users and you will learn all there is to know about Calamus

DTP.

AVAILABILITY

The CALAMUS USER is available now four times (quarterly) a year for the introductory price of $22.00 (US Dollars) postage paid to your address.

This "Fanzine" will only survive if you the user contribute to it's content. So, please help us to achieve our goal by subscribing to it.

For more information about this magazine, or if you want a years subscription please send checks (US currency only) made payable to:

D. Trutzenbach
31 Muskingum Drive,
Shamong, NJ 08088.

or leave Castle-Mail (E-Mail) on the BBS regarding your enquiry to Merlin or King Arthur (SysOp).

~ Remember The Windows NT version of Calamus will be available soon ~

>edge on that day.

Chris, believe what you want, but I used to be a GEM/ST developer and I
told myself that noone else's OS was better, but now I program for OS/2
and it has features Atari hasn't even HEARD of yet. GEM is severely
lacking in graphics /color manipulation, has no sound support, no movie
support, long filenames etc.. When/if Atari comes back, their OS will
need to be light years beyond MultiTOS if they want to attract new users.

Just my $.02.

-Bry

4194. Hard drives?

Newsgroup: comp.sys.atari.st
Date: 1994-11-30 01:05:59 UTC
From: psthomas@nyx10.cs.du.edu
Message-ID: <3bgj5n$cbn@nyx10.cs.du.edu>
Source record: 175751

Hi,

I was dusting off the ol' ST over Thanksgiving break, and I got to thinking about how it'd be nice to get it running "well" again. To do this, though, I think I'd probably need a pretty decent-sized hard drive, like around 60 MB at very least. Are hard drives still painfully expensive for the ST (that's why I shelved it in the first place, pretty much), or are they at least reasonable?

Or should I just buy a Mega or STe or TT or something... ? :-)

Thanks,

-- Patrick

4195. Q:AVI or APX

Newsgroup: comp.sys.atari.st

Skill required: multiplication. $250 x 4000 = $1,000,000. $250,000 is
a LOT of money to pay someone for organizing a contest!

I guess it's time to add ANOTHER company to the list of loser-users:

>I can upgrade to a Pentium, selling my DX2 chip to offset the cost.
>Works out to be a cheap upgrade.

I can see the benefit in PCs, although I like my atari. I just
wanted to say that upgrading to a pentium is not a cheap upgrade
considering its unfortunate bugs where it will deliver an incorrect
mathematical answer faster. I'd rather stick with a 486 that delivers
a correct answer in reasonable time. Besides, I wouldn't upgrade to
a pentium until the two million faulty chips are sold. (Intel won't
recall them, nor will they replace them for free - Kathleen Day from
the Washington Post)
Of course, this isn't even remotely the newsgroup for this thread.

>
<and some other info, which although interesting, were unnecessary
to quote>

First, neither I nor many other people on these atari.* newsgroups complain when people say things that, although unpopular, are true. That said, I would like to make it clear that these messages have little to do anything particularly atari, and more to do with people who seem to want to start flames. I have an atari, I don't care if there is no more official support, I don't need to hear that 'atari is going down in flames', 'atari sucks goat testicles', 'bail out of your atari before it's too late', or any of the other sentiments that I do not call here to read. Neither I nor many of the other people on this newsgroup mind hearing how atari has decided to cease production on the TT until further notice, even though it may bother us (I haven't heard that, it's just an example).

By the way, I'm not saying that you said any of this Roger, I just happened to get an itch when I read your message. Can't we just continue to support the atari as we do without resorting to unnecessary rhetoric and brow beating of those who enjoy their computer (any computer for that matter). I'm not pretending I'm a netcop, it just gets to me when almost (and sometimes over) half of the messages I get are nastygrams.

Anthony Jacques (jacquesa@cs.man.ac.uk) wrote:
: STOS has various problems on the Falcon. If run with the patch prog, off an ST Format
: coverdisk, it can be made to run, fairly well. The Missing Link extension adds
: joystick routines which work on the Falcon, unlike the original STOS ones. There is an
: annoying bug in the keyboard routines that cause STOS to detect keypresses when there
isn't
: one. I dont think this occurs when compiled...

I remember reading in Faucontact magazine (French Falcon fanzine) that
there is a STOS extension which lets you use the Falcon DSP and video modes.
I don't have it though, so no email saying 'send it me please'.

Also there is a patch from Goodmans which will fix most STOS errors. The
only one remaining is the joystick, but Missing Link fixes this. Or
there is a program which will place the new joystick tables into compiled
STOS programs (it works on old programs too, ie ones you havn't written
yourself). I got Color Clash working with it well plus lots others.

Some graphics commands fail badly, the BLIT command from Missing Link
being one of them. Also Mad Max music will kill the Falcon dead.

Regards,

Richard Davey

Steven Constantine (kaps3@central.susx.ac.uk) wrote:
: : : 3) Better sound (Most people have a SoundBlaster or a GUS.).

: : The DSP kill ssoundblaster.

: Why? What does your DSP do better than the soudblaster AWE32? You'll
: probably need to think about this for a while...

Soundblaster is a standard, but hardly any good. Got myself a
soundblaster and I'm not very impressed with the soundquality.
(A friend of mine bought a GUS the other day, and that soundcard is a
real winner, 10 times better than anything Creative can throw at it.)

: : : 4) Better keyboard (Which is quite important.)

: : I much prefer my ST's keyboard.

: Suit yourself! Personally I prefer a nice mechanical keyboard, freely
: usable away from the tower it's connected to.

All PC-keyboards are not good, I've found a few that is just as good, or
better than the Mega ST-keyboard. I use a detached keyboard to my Atari.

: : : 5) Cheaper hardware.

: : The Falcon uses standard SCSI-2 and IDE hard drives. No advantage either
: : way.

: : : 6) More software available.

: : This is true; but the PC has its entire software libreary available at the
: : expense of backwards compatibility back top its 8-bit days, which has
: : severely hindered the PC's advancements in terms of raw power.

: I severly unfounded statement I feel. Chech your facts first.

Why don't you check your facts.

: : : Anyone who hasn't understood this propably owns an Amiga...

: Not quite sure why we need to drag this machine into the discussion.

Me too.

: : : So what? I use a lot of different OS/computers, but I prefer my Falcon. OK,
: : : the PC's are faster, and the SGIs at school are "better" in every sense, but
: : : IMO they suck. I've got the programs I want (Hey, I've even paid for some
: : : of them!), the OS is so much faster and nicer, and I've got lots of friends
: : : with Ataris. So if anybody thinks that the ultimate thing is to own a PC

: : : because
: : : that's what everybody else owns, they have missed something. The lack of
: : : individuality makes these people pathetic...
: : :

I run an GUI OS on my Atari, with the same processor power as a 286,
and it is FASTER than windows on a 486...
(Windows on a 486DX2/66 is _slightly_ faster, as long as you don't
compare how long it takes to start a program)
(Anybody succeded in startin MS word in less than 10 secs?)

The only thing I have experienced as really fast on my PC, is to compress
files.

: : True ... I prefer my ST to the PC in every way. I've used PCs extensivey
: : and have _never_ liked them ... I don't like the OS (any of them), I don't
: : like the architecture, and I most certainly don't like the complete
: : modularity of design. I'll stick with Atari; they have everything I want in
: : a machine, and it does things the way I want to do things with a minimum of
: : fuss; the PC is nothing but constant editing of your AUTOEXEC.BAT and
: : CONFIG.SYS files.

: What a load of BOLLOX - I can't believe that you just turned a
: reasonable argument into a farcical blithering with your last statement.
: I spent nearly all my time on my Atari tweaking files left right and
: centre so as to make the damn thing work! Tweaking the .sys and .bat
: files of the PC is merely to make it work BETTER.

: Everything I ever did on my Atari required a large amount of fuss, and
: still bombed for no real reason half of the time.

Have no comment on that, seems to me that is speaks for itself...

Regards, Tommy

: words, it's probably not worth bothering with.

The software is written, and the procedure to connect a 2.88 mb diskdrive
is just about the same as connecting a 1.44mb diskdrive.
The main cost is to get an AJAX, since the standard WD1772 can't handle
speeds above 16 MHz (and that's tight too, most WD1772 can't handle more
than 12 MHz)

Regards, Tommy

> I want to upgrade Stacy from 2 Mb -> 4 Mb RAM; can I buy any SIMMS, or
> are some incompatible or better/worse than others ?

You need to buy two low-profile SIPPs, not SIMMs. SIPPs are basically the same thing, but with pins that plug into the memory board as opposed to the edge-type connectors that SIMMs use.

On the bottom of your Stacy 2 are two panels which open to allow access to the inside; one in the center under the carrying handle and another to one side (I don't remember if it's left or right, but it's the only other one there.) Open that panel, and measure the distance between the top of the SIPP sockets and the inside of the case; when you order your SIPPs, make sure they are no taller than that distance when measured from the top of the SIPP circuit card to the top of the pins.

One you have them, just plug them in the SIPP sockets, paying attention to pin orientation, and away you go...

>Go buy a sun sparc then. I fail to believe that you see the Atari as;

SPARC-based Suns are too expensive for the amount of power you get... a SPARCclassic is less powerful (CPU-wise) than a '486dx2/66, but much more expensive.

>1) a better games machine

PCs have new games, but the Atari has a large library of excellent older games. For better games, I turn to my Jaguar... PC games can't touch it.

>2) a better WP machine

Depends. I usually use MicroEMACS and TeX, or WordWriter II for word processing. WordWriter II runs VERY well on my ST, despite not being updated in probably 7 years. If you _need_ fancy fonts (if I do, I just fire up PageStream, the world's slowest DTP application on any platform) you're probably right, unless Papyrus and other SpeedoGDOS-using apps have magically gotten faster in the past year (not likely, since the hardware is still so slow). The apps are there, but the hardware is lacking, though it's probably quite nice on a Falcon or TT.

>3) a better multitasking machine

WELL, since Windows doesn't pre-emptively multitask, and MiNT/MultiTOS does... yes, it is. If you've got OS/2 or Windows NT or Linux (which all take away your ability to play all those games you mentioned in 1, above) then that's another story. Extra CPU power and RAM would certainly help here, but I routinely use 2-3 virtual consoles with MiNT, pre-emptively multitasking multiple users and programs on a wimpy 8Mhz 68000 with 4M of RAM.

>4) a better mathematical machine.

Well, last time I checked, it did raytracing just fine. Again, extra CPU speed would be nice. It's very painful doing raytracing on a 8Mhz 68000, but it did it almost as fast as a '386dx/33. Of course, you'll just say "everyone has a 486dx2/66 or Pentium now", but hey, not everyone does, even in business.

>Sure, music maybe the Falcon's forte, but don't try an pull the wool

From: mparrott@pnw.net
Message-ID: <3bhsu4$auj@cascade.pnw.net>
Source record: 175786

Panasonic emulating Epson LQ... well, obviously try using the LQ-570
driver first, if you haven't already. If that doesn't work, try using
the FX-80 driver. If THAT doesn't work, double check to ensure your printer
is, indeed set up to emulate an Epson printer. Also check the printer's
user manual to see if there are limitations to it's Epson emulation; many
printers emulate _most_ of the Epson command set while conveniently ignore
some commands that may or may not be important to someone.

When configuring the LQ570 or FX80 drivers, try playing with the options
each driver provides. You might find you can get it to work in Draft mode
but not NLQ mode, which would still be better than not at all.

If none of this helps, be sure to document all you've done, everything
you've tried to make your printer work with AW, including drivers used,
settings on drivers and the printer itself, everything. That way, it's
a lot easier for those on the 'net to try and figure out what may work.

Good Luck.

If anyone is patient enough to scroll down this far I'll
be very suprised.
Anyways, to confuse the ish, MHZ clockspeed or whatever only
gives an idea of the running speed of a processor.
If someone could contribute to this thread by posting a MIP
(million instructions/second) table of all the PC's and Atari machines maybe
we could clear up some fuss on the computational power side of things.

>
>I mean: if someone has a successful installation, he could do a package out of
>it which I then could just put under to e.g. E:\LINUX\.
>
>Is this possible?

I think a Linux install program would be easy enough to do, however, there
is no way you could just have it create an E:\LINUX directory and install into
that - you will need to dedicate a whole partition to it 'coz Unix uses
a different filesystem to DOS/Atari - it would end up similar to using the
MinixXFS with MiNT.

PC Linux comes with an install program that set's up whatever you want
- the atari one should be simpler 'coz we've got a standard as regards
hardware, so there is no need for the hundreds of drivers for 'obscure
video card X' and 'strange but quick kludgey SCSI card Y'.

(Going of experience with PC Linux, as my f030 has no maths co-pro yet).

Craig.

4222. ANNOUNCE: Stello 2.0

Newsgroup: comp.sys.atari.st
Date: 1994-11-30 14:16:16 UTC
From: atari@monet.name
Message-ID: <1994Nov30.141616.16894@imada.ou.dk>
Source record: 175789

Hello everybody.

Stello 2.0 othello is out with features such as

- Works under Gem, all Atari computers, all screen resolutions, (x resolution must be at least 640).
- Supports Multitos and WINX.
- Uses multitasking under Multitos.
- Advanced gameplaying algoritms, alfa-beta minimax, iterative deepening, response killer table, saves game tree and uses the zerowidth minimax modifikation.
- One of the best Othello programs in the world.
- Background pictures on the board as black/white or color.
- RSC files in english, german, french and danish.
- Dialogs in windows.
- Nice interface (3d buttons and checkboxes even under old tos versions, niceline menus, animation of disc's).
- Printing of moves, board and transscript as ASCII, GDOS or Speedo GDOS.
- Export of moves, board and transcript as ASCII or META file. This means that you can take the output and use it in a wordprocessor that supports import of META files.
- You can set the size of the output, (boardsize of 4 - 16 cm) 2 types of transcript, (with or without disc's) and turn on/off the border text (abcdefgh, 12345678)
- There is a (very primitive) fontselector, and you can choose the output device (printer from 21-30 and meta file from 31-40)
- Context sensitive help with St-Guide.

New in Stello 2.0

This is a major update. Here is a list of the most important improvements.

- I have implemented the zero-width minimax modification in the normal alfa-beta search, which means 10 % fewer nodes to examine.
- The "brain" has been much improved, which means that it now gives a more accurate and stable evaluation of the positions.
- Endgame search now 10% faster. (16000-23000 moves/sec on a TT)
- Special endgame search mode where Stello can search for a "Win", "Win/Draw" or "Max disc". The "Win" search is 10-50 faster than the "Max disc" search, and in extreme cases up to 200 times faster.
- Stello now evaluates its commandline, so you can drag games to its Icon, and it will then load it, and you can install Stello with a DOC type of "GAM", so it will start and load a game if you click on it.

- Stello now also supports the drag & drop protocol under Multitos.
- The filename is displayed in the game window so you can see what
game you have loaded.
- Manual input of games is now completely mouse controlled.
- GDOS and Speedo GDOS is now supported. This means very nice output
via printer and META file. If you don't have GDOS you can still
print and export as ASCII.
- Window with transcript of game.
- Context sensitive helpfile for St-Guide.
- various bugfixes (It should now finally be possible to load games
and pictures on TOS 1.0 and TOS 1.2)

More details in the documentation. Stello is a Shareware game. I have
uploaded the game to the following ftp sites, in the file
STELLO20.LZH.

ftp.uni-kl.de
ftp.uni-paderborn.de
ftp.cs.tu-berlin.de
atari.archive.umich.edu
micros.hensa.ac.uk
ftp.cnam.fr

Happy Othello playing.
Claus J. Pedersen.
atari@imada.ou.dk

Feel free to comment here. How do you like Stello. Do you want more
strategic games in the style of Stello. Let me know by Email or post in
this group.

Hey Rob,

I recently used Ghostlink to transfer about 2GB of files from a Falcon030 to a 486 hard disk (Suzy B CD ROM project). The program worked well for me. I used 115,200 baud with no problems.

I have been conversing with Henry van Eyken (CN author) via e-mail and he has been using Ghostlink to transfer files to his HP handheld successfully. I suggest you send him some mail.

Best of luck.

Dave

Look for a program called winlupe, it's a nice gem program which magnifies either the area around the mouse pointer or a fixed part of the screen, in a window. The latest version is 6.0 I think.

You want aes compatible mode on, this means it unfortunately won't try to magnify when in a menu or modal dialogue, but that's better than the alternative of obliterating them if they happen to overlap it's window, as happens with it off.

Are you sure it's worked properly, look at the disc with the latest gemini or with a file selector that supports long names (I heard that the next version of selectric would?). The ls built into tcsh does support long filenames, although the gnu ls from the mint distribution kit doesn't.

Falcon is miles behind on MIPS compared with a DX2/66 or whatever.

But it doesn't have to run Windows...

ST Review has been bought by ST Formats owners and is no more. The editor
and judging by the comments y them on CIX, most of the writers, will not
move to STF. To say their has been much of an uproar at this news is an
understatement.

Total and utter bummer. RIP STR. :-(

NO!

It was ST User that has now been absorbed by ST-Review both published by Europress.
The ST Action section and some staff writers have moved across.

ST Format is from a different publisher.

OH SHIT!

4239. Best simms for STE upgrade?

Newsgroup: comp.sys.atari.st
Date: 1994-11-30 18:11:44 UTC
From: blade01@pplnet.com
Message-ID: <016288HBAHSJVDUPFYCU@pplnet.com>
Source record: 175716

IH> What simms are needed to take a 1 meg STE to 4 meg? Is there anything
IH>special about the installation? Is there any software follow-up needed?
IH> Does anyone know of on-line instructions for the upgrade posted
IH>anywhere?
IH>--
IH>hellman@teleport.com Internet Public Access User Hillsboro, Oregon USA

Use 1 meg x 8 or 1 meg x 9 SIMMs - either one is fine, but use 4 of the
same kind. If you use the 9-bit SIMMs, it doesn't matter whether they
are 9-chip or 3-chip, just get 4 alike.

Take the case off the top of the STe by removing the screws in the
square holes underbeath. Right in the center of the top inside, there
is a little box fastened to the shield; remove the screws holding it in
place. Touch the sheild with one hand while removing the box, and keep
that hand in place to prevent static discharge between your body and the
computer. Pull each of the old 256k SIMMs away from their stops, then
up and out of the socket, and put them in a static-proof bag. Put the
new 1 meg SIMMs into the sockets and push them down and against the
stops until they snap into place. Put the SIMM box back on and fasten
the hold-down screw, then put the top back on the STe.

You're done! Run a RAM test program and make sure all 4 megs are good;
then have fun!

If you just want to have a more reliable computer, consider a TOS upgrade.
I own a MegaSTE with TOS 2.05 and it does not crash more often than the
average Windows PC. (In addition, this is a much cheaper solution than
buying a new computer.)

If you want to have access to DOS/Windows software, then you can't choose --
you have to get a PC. But, maybe, if you give more details of what software
you're dreaming of, maybe others can give you hints about equivalent Atari
software (and there is equivalent Atari software for the most common PC
applications).

Some time ago, somebody posted a comparison of the speed TeX needed to
format a certain document on different systems. Although not as precise
than MIPS or FLOPS or whatever, this gave an impression of what performance
a user can expect on a certain system. Graphics is a completely different
thing, though, and I have not seen a comparable graphics benchmark (maybe
somebody has a good idea we could try?).

If somebody has the "TeX benchmark" at home I'd strongly urge him/her to
repost it :-)

] You should look into PC-Xformer by Darek Michoka of GEMulator fame.
] Judging from the buzz in comp.sys.atari.8bit (where you should ask for
] more info) it seems to work very well. Darek actively supports this
] product, too. You can email him at darekm@microsoft.com for more
] specific info.

The PC version works amazingly well. The ST version works, but not
as well, and Darek no longer supports it, (or indeed, anything created
for the ST). Everything he does now is made to take sales away from
Atari, not create them! :) And, the products aren't bad for the
job!

AFAIK, as Hutch says, the PC version is still fully supported.
(Needs at least a 386-33 to be of any use!)

: Well, you won't need to worry about that any more, as it has been swallowed
: up by ST Format. The next issue will be the last. :-(

: ST Format is as expensive, but is shite. We will miss ST Review.

I have been going around in a totally peeved off mood all day long...since I read about this last night...and Vic confirmed it today via e-mail. :-(STReveiw should not be the one to go....but as we all know...STF wants STR out of the way...and so this way STR will not be on the streets...leaving only STF.

I honestly think that STR is a better mag for a certain niche of the STR market...being more technical...especially since it used a number of contributors...and that pooled together a wide experience...

I also prefer STR.

But but but... it will be with us no longer. 8...(

IMO, it is bad that there is only going to be one ST Mag out there....STF should have thought about this a lot deeper. having just one mag on the shelves is not very good for a platform....then not many people will be willing to buy a second hand ST....and not many people will want to buy a *new* Falcon, or even ST....and the number of Atari owners will fall...and STF will finally go out too. I'd say, in the current situation, and with what I predict, STF will only last for the best part of another year...and that's it.

At least with 2 mags on the shelves, people knew that the Atari platform existed....

Isn't this similar to what happened with the Sinclair computers? One mag was left....and then none...as there were veryt few Sinclair computer owners left.

Message-ID: <D03HCJ.Ar1@info.bris.ac.uk>
Source record: 175713

Does anyone know anything about TDSM (The Digital Sound Module) for the Falcon, currently being worked on by System Solutions and some others? Can it be run on the same computer as is running a sequencer, instead of just playing SMIDI files. I hear different sound sets can be loaded, such as other samples (vocal etc). This out-price-performs the Akai DR4d (hard-disk based sampler). ST Review suggests that it is possible to run a sequencer in parallel with TDSM.

Whatever, could you tell me more?

Many thanks to all of you who wrote to help me with my failing SM124,
I hope it will soon be well. In the meantime my ST 1040 has decided to
get sick as well :(

When I power up:

1. The screen raster comes on, but rolls vertically.

After a few resets, I get:

2. Blue and yellow vertical bars on the screen

After a few more resets I get:

3. A blinking blank, but steady raster

After a few more rests it boots, phew!

What the hell is happening?

: as ST
: thanks for any info

: Ps. Its for emotional reasons...

On the ST, there's ST-Xformer by Derek Michoka. It's not terribly good; it
can run some assembler programs, but mostly it runs Basic programs, and
extremely slowly at that. Derek also did recently a version of Xformer for
the PC called PC-Xformer that is supposed to be far better than the ST
version.

4256. Zmodem Accesory

Newsgroup: comp.sys.atari.st
Date: 1994-11-30 20:02:00 UTC
From: cmothers@netcom.com
Message-ID: <cmothersD03JnD.vt@netcom.com>
Source record: 175720

Is there a Zmodem Accessory, I heard GRZSZ43 is one but it is cripple ware.

Right now the best thing I found for internet is Ansiterm 1.91, I tried
almost every other one and I seem to keep on going back to it.

sj>
sj> Anyway, that's all as of now.

I did exactly the same as you, and it worked for me. But you *HAVE* to
increase the stacksize of g56k and the preprocessor. Around 300k
should do the trick. Other than that, you need motorolas c-libraries
to do anything useful (which I don't have).

All you need are 4 - 1Meg SIMMS. pin numbers I dont't know from Adam, but I
do know I used Macintosh SIMMS

Hi again. This is a follow up. To do my upgrade, I unscrewed the five screws holding my 1040 together, unscrewed the metal cover, pushed aside the snaps holding the SIMMS in, pushed the SIMMS forward and lifted them out. Reverse the process for installing your SIMMs No software follow up needed, I've never seen any on-line instructions, as the process is pretty simple. If you don't feel comfortable doing this, perhaps a dealer could do it for you. I f there are no Atari dealers, a MAC dealer could do it, or a friend who's done it before or is comfortable doing it. Bonne chance

Most Ataries suffer from Dirty Contacts with the IC sockets, so just remove and
re-insert all pluggable IC's..

The Larger PLC had problems with the sockets, they would crack, it was not
untill the last batch of STE's that Atari changed the Brand of Socket..

Atari did fit clips first to stop the IC's getting loose, then added a clamp to
stop the sockets from cracking...

If you don't have a PLC puller use a very small screw driver, and carfully lift
out PLC IC...

There might be one saving grace, but I'm sure it won't happen. It's not the incompetents at STF that are taking over but the Publisher. I wish they could be convinced to buy up STR, but dump the STF journos instead. Then we could keep all the better guys - simple 8^{)

> Danny (who is totally pissed off)

You're not alone 8^{<

btw that's not directed at you (I know you've got something coming up in the next issue), nor Frank, Andy, Don Maple or Peter. The rest are definitely doing more harm than good.

IH>-Hutch- @ Fair Dinkum Tech

I can't speak from certain knowledge, but it seems unlikely that Atari
would use the parity chip - that would add to the cost of the system, as
the stock Falcon has discrete DRAM chips on a daughterboard.

I'll bet dollars to doughnuts that Gizmo knows for sure, though. He
designed the SIMM board for the Falcon030.

```

Correct, Doom almost completely bypasses DOS, the coders wrote their
own DOOM-OS so that the game would run faster than 5fps on a 486. All
they need is to add a CLI to the OS and sell it as an MSDOS replacement :)

J >

I don't really understand these prices.
In France I bought last year a second hand TT, with 8 Mb (4 + 4) and a 80Mb disk, and a 19 inches monochrom monitor for ~$1000 US !
And a few monthes ago, I bought another TT, with 8 Mb (4 + 4) and a 48 Mb disk, and a 19 inches monochrom monitor for ~$950 US !!

For $4800 US, you can buy a Medusa !!

> assistance I'd greatly appreciate it.

Atari Works is designed to work with GDOS, FontGDOS, FSM GDOS, or SpeedoGDOS. It will also work with at least some of the GDOS replacement products like G+Plus from CodeHead Software.

The printer driver from WordUp was written to work with the kludge that NeoCept put out to try to improve GDOS for their app alone.

FontGDOS is freely distributed on the nets, but you'll get much better results with SpeedoGDOS. Yes, it will cost some $$, but the output is gorgeous. I'm sure you'll be pleased.

You're certainly entitled to your opinion, but I confess to being surprised at your assertion that they're doing very little. Just off of the agreements and cash infusions alone that they've had this year, they'll do very well..

> (Have you counted the number of available jaugar games to date???)

Yes, have you counted how many are in development? And how many developers there are? The system is brand new, just a year old. It will take developers time to learn how to take advantage of the Jaguar.

Atari may not be in the business that you want them to be in, but they do know how to survive until they get a hit product. I belive the Jaguar is that hit.

> Does it have a Falcon compatible sound-system etcx?

Well since the product doesn't exist, and never has, you can make up whatever specs you want, Peter.

How can "full specs" for a rumor possibly be posted????

Especially a rumor that isn't true!

regards,

Bob Brodie

Hello,

I want to connect a 1.44 Meg Floppy drive to my 1040STe. I got a file from the umich.edu FTP site that talks about replacing the GAL inside the computer to drive this size floppy. Has anyone else done this and has it worked for them? Will I be able to drive an external 3.5" 1.44Meg floppy and/or replace my internal drive with one? And, is there anything else I would need to make this work? Thanks for any help.

Theron

> Where can I find utilities for Atari on Internet ? - Freeware please !!!

Use ftp (see FAQ below) or Lynx (search "atari" -keyword).
a couple of ftp sites for starters: src.doc.ic.ac.uk
(pub/packages/atari/umich/) and nic.funet.fi (pub/atari)

ftp instructions are available in every library and in the FAQ-
file below my signature:

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.

i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.
Use the appropriate decomompression program for this.
- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:
- mdir [CR] to show disk-directory/space left.
- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)
- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")
- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt dlist.txt"
- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

4279. Mega STE Shifter problems

Newsgroup: comp.sys.atari.st
Date: 1994-12-01 00:20:37 UTC
From: lnonvei@public.srce.hr
Message-ID: <3bj4sl$7pa@nippur.irb.hr>
Source record: 175738

Hi there!

I have Mega STE (TOS 2.05) and problems with sound and color graphics.
When I connect cinch ports with my stereo I can hear some high tiny klicks
(nice description) in sampled sounds (tracker modules). Same modules and
stereo works fine with 1040 STE. So I tried to disconnect all other stuff,
and use other programes and same thing happens again.
And problem with color graphics? Well it looks like your scolling whole
picture one pixel left and after that one right, sometimes rapidly. Also
Photochrome (8 MHz no cache) have some lines blinking in top and low border.
And again 1040 STE works fine with same config.
In "Chips 'n Chips" (a file list of chips for ST/STE/TT/FALCON) I found that
Mega STE`s has got two kinds of GST-Shifter chips. Mine is C301712-001
and one WITHOUT sound problems (they say) is C300588-001. Buuuuuu.....

Anyone has same problems, or knows something about that?
Has anyone got correct chip to trade or sell? How much is it cost in
Germany or UK and where to ask?

Thanx.
Loris

Unfortunatly the great hope for a clean system is the PowerPC chip. Until Apple/IBM get their act together on this *and* convince the clone manufacturers to follow - then we are stuck with PCs, Macs and whatever Atari supplies.

I've copped out and bought a PC. I was waiting for a decent PowerPC machine (I don't like the current (or about to become available) PowerMacs much) and my is TT going to be obsolete in 2 years time - letalone the MSTE I used to own - or the STM I've had since 1986.

I'm not selling the TT though. Its still a fine bit of kit - and I have lots of software and uses for it. The real money is going to be spent on the PC from now on though.

BTW You might be surprised just how cheaply you can buy a reasonable PC. It depends what you want it for. Really powerful PCs cost a lot of money though.

>
> HELP!!!!

I had this problem with STraight FAX for awhile, too. Turned out that I had added an ATZ string into the dial menu someplace, perhaps as an Init String, or a prefix. (Sorry I can't be more specific...I'm at work and don't have my Atari close by)

Once I got rid of the ATZ I'd added, it worked like a charm. The only other changes that I ever made were in the dial menu, to add a 9, to get by Atari's PBX system for an outside line.

Hope that helps!!

> the FX-80 driver.

Actually, there is another option he should try before going to the 9-pin driver. Try the Star NB-24-15 driver.

Some of the earlier Epson LQ models don't work with the newer LQ drivers very well. For example, my LQ-510 prints garbage with the LQ-570 driver, but gives out much better results with the Star driver.

The other driver to try is the NEC-P series driver. There are a total of three 24-pin drivers with SpeedoGDOS. One of them will probably work, depending on how he has his printer set up. With some printers, all three will work but with varying quality. The NEC has the higher rez of the three drivers. On my Star SJ-48 (kind of a clone of a BJ-10SX), all three drivers work, but the NEC driver gives far and away the best output.

If you use the Universal Item Selector, calling it (with the accessory, which
is easy to hit with an "invisible" mouse) usually fixes the problem.

4289. PAK 68030 Accelerator

Newsgroup: comp.sys.atari.st
Date: 1994-12-01 04:08:14 UTC
From: "David C. Troy, Toad Computers" <toad@charm.net>
Message-ID: <3bji7e$t03@canton.charm.net>
Source record: 175747

Does anyone have any experience with the PAK 68030 accelerator?
We're having trouble getting them to come up on a Mega 2 ST.
Just get a blank white screen, or in mono a blank black screen.
Blitter is disabled, 2MB RAM, jumpers seem to be set right. I have
tested two of them on the same machine with the same results. The
Mega works otherwise with a 68000, AdSpeed and T-28 accelerator.

Please send e-mail; we're trying to get info so we can get this
thing up and operable for our show this coming weekend.

Any help is sincerely appreciated.

Check your dialing prefix under the preferences->dialing menu.
Make sure it's not adding anything extra in there.
What kind of modem do you have? Have you tried running SYSINFO2.10?
Send me the results file if you have.

: Roland.

I find with most hardware, the UK is about the most expensive place to
order from. A friend of mine just got a external mac CD-rom for roughly
$200 from a store in California.

Sorry but its all crap, stated that is developed by Atari Germany, well from what I have read here many many times there is No Atari Germany...

Looks like its being put out by Teenagers, I for one don't take any notice of the posts in rec.games.video.atari, most of these post are from nutters and such like that don't even have a brain...

Well after reading here that ST-Review is now closed, well at least it shuts up those people that have stated here many many time how good Atari is doing in the UK etc..

From the missing Adds in these Magazines, it was obvious that thing are not good at all...

With out magazines the Atari platform is dead....

As I say Atari R.I.P. long live the Acorn...

Hi there,

I just read the bad news about ST-Review and since I really HATE
St-Format, I wonder what will happen to my just-renewed subscription.

If I read well the next issue will be the last one , that means I will
start to receive ST-Format ? Blah! Time to stop the subscription and
save some money.....or,maybe, we will see a bigger AND better ST magazine ?

** sigh!! **

Steve Wells (wells_s@ix.wcc.govt.nz) wrote:
:] Has anyone used Kobold yet? Will it significantly improve file operations
:] even if you are not using MagiC? Can it run in conjunction with Neodesk,
:] Geneva, regular TOS 2.05 or Multitos?

: It won't work with any of the above, other than Magic+Ease.

That's wrong. If definitely works without MagiX and/or without Ease.
It is specially supported by Ease & Gemini (i.e. Kobold can be used
for copy, delete, format operations etc. even if you invoke them by
the Ease and Gemini *Desktop*)

: It writes the files using a semi-illegal method.

But Kobold provides a safety mechanism (CHKOFLS) to prevent other
programs from writing to the same partition at the same time.

But it's very reliable, and fast.

That's also my experience.

: It doesn't appear to work with Geneva at all,

Maybe. (Nearly) nobody uses Geneva in Germany.

From: npetrlik@public.srce.hr
Message-ID: <3bk4u4$9n3@nippur.irb.hr>
Source record: 175616

Hi !

I have a single ST (not a part of any network,
just my ST), and i want to do the following :

I want to connect to my local internet host
using SLIP protocol.
Normally, when i want to connect to my internet
host, i start Rufus, then dial phone number (ATD)
of the local internet server and then using the
telnet protocol connect to my internet host.
Now, how can i do the same, but not using the
telnet, than SLIP protocol ?
I have downloaded ka9q/nos (NOS.TTP and the rest
of the including files), maybe this could help ?
Well, that's my problem ....

Thanx for help

The one glimmer of hope is ST Applications (despite the current ruckus over the CD-ROM :-) One reason STA gave two issues ago for removing certain aspects of the magazine (some articles etc) was that they did not wish to overlap with STR. Now STR is going, there is no reason (apart from finances) why a new, improved STA could be launched with perhaps some of the STR staff at the helm.

:In <3beubv$br6@infa.central.susx.ac.uk>, Steven Constantine writes:
:>Go buy a sun sparc then. I fail to believe that you see the Atari as;
:
:SPARC-based Suns are too expensive for the amount of power you get... a
:SPARCclassic is less powerful (CPU-wise) than a '486dx2/66, but much
:more expensive.

yes this is true.

:
:>1) a better games machine
:
:PCs have new games, but the Atari has a large library of excellent older
:games. For better games, I turn to my Jaguar... PC games can't touch
:it.
:

say that again? don't compare the games for the jag with old dos games,
compare to them to the lates PC games. I think PC games *can* touch
jag games!

:>2) a better WP machine
:
:Depends. I usually use MicroEMACS and TeX, or WordWriter II for word
:processing. WordWriter II runs VERY well on my ST, despite not being
:updated in probably 7 years. If you _need_ fancy fonts (if I do, I just
:fire up PageStream, the world's slowest DTP application on any platform)
:you're probably right, unless Papyrus and other SpeedoGDOS-using apps
:have magically gotten faster in the past year (not likely, since the
:hardware is still so slow). The apps are there, but the hardware is
:lacking, though it's probably quite nice on a Falcon or TT.
:
:>3) a better multitasking machine
:
:WELL, since Windows doesn't pre-emptively multitask, and MiNT/MultiTOS
:does... yes, it is. If you've got OS/2 or Windows NT or Linux (which
:all take away your ability to play all those games you mentioned in 1,
:above)

This is not true. Ever heard of a bootselector? I have a 200Mb partition
with OS/2 Warp and MS Windoze on it. this is a dos partition, all my
games are located here.
Then I have a 220 Mb partition with Linux. I usually use this. But to play a
good game, just reboot from the dos partition.

:then that's another story. Extra CPU power and RAM would
:certainly help here, but I routinely use 2-3 virtual consoles with MiNT,
:pre-emptively multitasking multiple users and programs on a wimpy 8Mhz
:68000 with 4M of RAM.

performance?

:
:>4) a better mathematical machine.
:
:Well, last time I checked, it did raytracing just fine. Again, extra
:CPU speed would be nice. It's very painful doing raytracing on a 8Mhz
:68000, but it did it almost as fast as a '386dx/33. Of course, you'll
:just say "everyone has a 486dx2/66 or Pentium now", but hey, not
:everyone does, even in business.

wait another year: no one in business uses Atari, everybody has at least
a fast 486.

:
:>Sure, music maybe the Falcon's forte, but don't try an pull the wool
:>over everyones' eyes that the PC can't manipulate music.
:
:As long as you don't try MIDI work from Windows...

stop thinking PC = DOS/Windows. it becomes boring.

4305. Help: Reviews needed for HENSA

Newsgroup: comp.sys.atari.st
Date: 1994-12-01 11:48:51 UTC
From: vctec@westminster.ac.uk
Message-ID: <D04rHH.EMC@westminster.ac.uk>
Source record: 175624

Hi all

I need your help...as much as possible.

I need some reviews for PD software that is on-line at HENSA. I will need these for Monday morning the latest...and would appreciate if you all would help me. Reviews can be for software like WinX, Gemram, Shbuff, Let em Fly...etc etc..anything that is on hensa.

The format of the review is such:

Title (of software)
Version
Author
iDirectory
Reviewer
Date of Review

Review Equipment (as in machine, processor, CPU clock, memory, display, OS)

About the package

Installation

How it performed

Conclusion

That's it.

I hope you kind people will help me out with this one. I would also appreciate the reviews in my mailbox soon...and before Monday morning...as i will not be able to do anything to them (ie put them on-line) after that time...till sometime in the New year.

I want to save the Atari section here from closing down....and reviews from you users about software here, would show that it is being used...

I look forward tyo your replies....multiple entries are accepted... :-)

Regards
Danny

It's worth noting that, much to the annoyance of the PC community, Doom -
that pinnacle of PC games, was not developed on a PC at all - Id use
a NextStation as their development platform and port to everything else
(PC included) as the PC wasn't up to the job.

That's exactly how my Falcon behaves without Backward!!
Maybe if you tried to switch the CPU-Caches off before, but I suppose that's harder on the TT, than the Falcon since Backward is a F030 prog.

It might also be some problem with the sound in that scene!!
That's a big problem on the Falcon, but since I have no idea how the TT's sound is compared to the Falcon's, I can't say for sure.

The ST/STE had some nasty possibilities of using strange addresses when using the sound chip, that, AFAIK, is missing on the Falcon.

Stefan

A point to the Eagle.
It should be available right now here in germany - don't know
exactly 'cause I didn't order one... But there will be a
exact test in one of the next ST-Computer's and they showed it
in the newest one. So it IS actually available but it has
no Falcon souns system, but this is in development.
The Eagle has a very flexible bus concept. Via an small
adapter you can plug in PCI graphic cards.
It is avaiable with an 68030 (40 MHz I think) and there
was something with the 040 Version. If I remember right
you purchase the 040 Version jet and get a 060 when they've
finished the card. (The Eagle works with CPU cards).

I guess I'll have to bring the last ST-Computer here to type
in some more information...

Read you later

Ok. Try to get WinRec and then get yourself a DSP LOD
disassembler. There's one available on ftp.uni-kl.de
pub3/atari/falcon/...
Disassemble one of the LOD's (e.g. ECHO.LOD). Now you
got a brief overview of how to programm the DSP.
The WinRec LOD's get their sample data via the matrix
and their parameters via Port B (I think).
If you have problems getting this running email me
and I'll send you some of my sources.

And you could help me with some little question:
How much does the Motorola DSP56001 Users' Manual cost ?
And what is it's ISDN number ?

Message-ID: <1994Dec1.132538.29689@unix.brighton.ac.uk>
Source record: 175631

When using Mupfel and wish to execute a file in the current directory, I keep getting a file not found message - the only way around this is to include the path in the PATH variable (impossable as youcan't put every path in this statement), or use the hash -d a:\ command which puts all executable files on drive A in the hash table.

This is also a problem as it means you have to do this command each time you put a disk in - surely you should be able to execute a program that is in the curernt directory by just typing in it's name and not have to rely in it being in the PATH or hash table?

In Germany the new Toshiba 5201 (3.3 speed, SCSI-II) sells for about 350,-- DM.
Thats about 220US$ or 140UKï¿½.

Bjoern Brauel and the other guys are currently working on a plug an play easy
to use installing tool.

I dunno when it's going to be available but they're definetely working on it.
A CD with the complete distribution will be out soon as well.

4317. Atari stfm and blitter chip

Newsgroup: comp.sys.atari.st
Date: 1994-12-01 15:17:19 UTC
From: targa@werple.apana.org.au
Message-ID: <3bkpdv$jc5@werple.apana.org.au>
Source record: 175647

I have fitted a blitter chip into the place provided on my stfm motherboard..

I am runing tos 1.4....

Is there any jumpers on the board which are needed, or any other
requirments to get the st to recognise the blitter.. I installed a 68 pin
PLCC socket and currently have chip removed as it gets no further than:
white screen, disk drive access...then sits there with white screen...

I am running tos 1.4...
My motherboard is one of the last revisions which has mostlyu surface
mount chips..I have 4 meg in my machine..

Any suggestions greatly appreciated

regards

richard

Message-ID: <9412011632.AA52785@cluster1.urz.uni-halle.de>
Source record: 175636

There seems to be some confusion about these machines in this newsgroup. So lets make some things a bit clearer:
-Medusa: its out for some time; it is a 68040-TOS-clone from Medusa Systems Switzerland. The new 68060 version was shown at Pro-TOS and will come out in the near future (price will probably be around 6000 DM)
-Eagel; it is the second Atari-Clone. It was in development over a year, and the first Eagel is ready now. It is an 68040-machine, but the first Eagels will come out with an 68030, but there will be a free upgrade to the 68040. The processor is sitting on a card, so that the machine is easy to upgrade. The Eagel-developer is GE-Soft from Germany, and the Eagel was on the Pro-TOS show too.
-Milan: thats only a rumour. We have to wait until CEBIT 95 to see if the rumour is true or not. But I think there is a little chance that the rumour is true. So keep cool and wait a bit...

Alternatively, check out NVDI 3, which not only accelerates your
entire display, but also gives you your outline fonts. NVDI 3 has a
utility which you can use to build your own printer drivers.

>board for the Falcon is said to be shown on the proTOS-Show last weekend.
>The board is manufactured by an american company called "best electronics".

Best Electronics were in Hennef that weekend. I've talked to the developer
(Bret Korda) and he told me a Falcon with a running Barrakuda will be shwon
at the UK-shows. The board is expected to be in shops around X-mas for 1k US$.

The Barrakuda comes with some extra electronics for grafix and DSP
acceleration as well. And it uses 32-bit wide Flash-ROM's with one waitstate.
So a patched TOS can easily be loaded into the ROM's as TOS 4.0x is not
040-ready.

Bret told me about another project he is working on: a 68060. But this in
very (emphasize very) early stages. It should come with PCI-bus and
Fast-SCSI-II.

>And what is the Afterburner doing? Last spring I ordered information from
>Overscan/Berlin and for 2 or 3 month I got lots of papers about all their

Well, as far as I'm into this matter I would not wait for the Afterburner any
longer. IMO it was a dead born child in the first place.

>Could we Falcon owners speed up our beloved bird by an accelerator board to
>040 or do we have get a Medusa?

IMO get a decent 040-MAC and MagicMAC. Could someone fill me in on the various
PowerBooks available?

In a previous article, <STIRRE31@MAINE.MAINE.EDU> (Scott Tirrell) wrote:

> It is too bad to hear Atari's poor attitude.

What 'poor attitude' are you referring to? And who from _Atari_ said anything to give you that impression? Like any other company, they are out to make a profit. We might not like how they choose to do so but hey, that's free enterprise for ya. It's NOT a religion.

> Perhaps a few e-mails from the Atari net community would help?

And who are you going to send them to? Who from Atari will read them? More importantly, who from Atari would attempt to act upon them? Like Bob Brodie said, the Jaguar is Atari's sole focus right now. If that makes them a heap 'o money, then we -might- see new Atari computers (likely based on Jaguar technology) some day in the future. Maybe.

> Mr. Brodie and Mr. Townsend have been seen on the Net.... perhaps
> they could pull some strings for us ;-)?

Don't count on it. While I'm sure both are still held in good favor and high esteem at Atari, neither work there anymore.

> I would love to see Soft PC for my Falcon. What do others think?

If you want to see Soft PC for the Falcon, you would be better off to write to Insignia Software, not to Atari. This has been hashed over countless times here, but again, I would not hold your breath. Quite simply, there is just not a large enough market to make it worth Insignia's trouble to bring that product to life. The public just seems to have no idea what it costs to produce, market and support a commercial software product even -after- all development costs have been taken into account. No profit potential == no product.

And to be totally honest, using a DOS/Windows software-based emulator on a 16MHz 030 would be far too painful (sloooow) to be usable, IMHO. On occasion I use SoftWindows on a PowerMac 7100/66 and that is just -barely- fast enough to be worth having, but not for day-to-day use.

4337. Re: ST is ok now :))

Newsgroup: comp.sys.atari.st
Date: 1994-12-01 19:11:00 UTC
From: Ian_Taylor@a2w.maus.sub.org
Message-ID: <199412012111.a34393@a2w.maus.de>
Source record: 175686

Good news at last, a fellow Atarian came over with his tools and fixed my 1040 ST. A capacitor in the power supply was failing and caused the 5V line to drop to under 4 volts, over a few minutes the voltage came up enough to allow a boot. As the voltage came up different functions would work - nice one eh?

All I need now is the SM124 back on line, *many thanks* once again to everyone who helped.

Ian_Taylor@a2w.maus.de

4338. _ONE_ byte in SIGNUM-2

Newsgroup: comp.sys.atari.st
Date: 1994-12-01 19:16:14 UTC
From: diwil@rphd.stu.spb.su
Message-ID: <AAKRQtkO65@rphd.stu.spb.su>
Source record: 175650

Dear All, Hi!

What should I do if I want to print under signum2 editor
with resolution 360x360 on Epson LQ-100?

This mode is available only for "NEC p6 p7". Control code for
this printer is not ESC, but all other code sequences like for
Epson... So, I think, if I change "not ESC" to "ESC" (I think it
is 1B and 1C) all be Ok. WHERE I should change it???

If you know, please reply on diwil@rphd.stu.spb.su
or FIDO: Dima Wild, 2:5030/153
or send UUencode pr24n.prg

Thank you in advance,
Regards, Dima.

] The main cost is to get an AJAX, since the standard WD1772 can't handle
] speeds above 16 MHz (and that's tight too, most WD1772 can't handle more
] than 12 MHz)

I've got one of the last STes ever made for the main sales batch,
(TOS 1.62, and various differences), what's my chances that it has
an AJAX chip in the machine, or was it only the Mega-STE's that
occassionally had them in it? If I don't, what would be the cost and
hassle involved in finding an AJAX and a gadget to up the clock speed?

>that PC's and Atari's use. The only difference is the connecting
>cable and telecommunications software. I personally use the same Supra
>14.4 FaxModem on both my Atari -and- Mac via a simple cable switch.

Some Mac models require a different handshake mode - they don't have RTS and
CTS lines on their serial connector. Most external modems have different
factory settings for that, and they all have an AT command (AT&Kn for Rockwell
based stuff).

bye, Peter

4341. Re: Mega-Depack v2.13/New Depack v1.00

Newsgroup: comp.sys.atari.st

] : stable, multitasks properly, and recognises more pack-formats.

Okay, you can get New-Depack from atari.archive.umich.edu in
./atari/Utilities/ as ndp_1.zip

I think that would be:

ftp:/atari.archive.umich.edu/1/1/atari/Utilities/ndp_1.zip with
WWW. But don't quote me on that! :)

4342. RESULT: comp.sys.atari.programmer passes 193:35

Newsgroup: comp.sys.atari.st
Date: 1994-12-01 20:12:06 UTC
From: rdippold@qualcomm.com
Message-ID: <comp.sys.atari.programmer-RESULT@uunet.uu.net>
Source record: 175648
Cross-posted to: news.announce.newgroups,news.groups,comp.sys.atari.st,comp.sys.atari.st.tech

RESULT
unmoderated group comp.sys.atari.programmer passes 193:35

There were 193 YES votes and 35 NO votes, for a total of 228 valid votes.
There was 1 abstain and 1 invalid ballot.

For group passage, YES votes must be at least 2/3 of all valid (YES and NO)
votes. There also must be at least 100 more YES votes than NO votes.

There is a five day discussion period after these results are posted. If no
serious allegations of voting irregularities are raised, the moderator of
news.announce.newgroups will create the group shortly thereafter.

Newsgroups line:
comp.sys.atari.programmer Programming on the Atari computer.

This vote is being conducted by a neutral third party. For voting
questions only contact rdippold@qualcomm.com. For questions about the
proposed group contact Yat Siu <ysiu@lexicor.com>

CHARTER

Summary: a newsgroup for the discussion of programming on the atari
TOS or 8bit computer and any clones or otherwise

The proposed group will provide a forum for the discussion of
programming queries, discussions of techniques or anything else that is
related to programming on the atari for any language that exist on the
atari (scheme, gcc, c, basic, pascal, assembler etc.)

Justification:

There are currently several comp.sys.atari.* newsgroups, however
none cover the aspect of programming questions. Atari Computer systems
(8bit, 16 or 32bit and clones) have various development tools from other
third party developers, some of which are very good. Atari Users require
a forum where they can ask questions about programming in any language.

This new newsgroup is also meant to encourage programming on the
atari and asking questions regarding programming. Very often programming
questions are asked in other forums, but they either don't get a reply or
ignored because it is not related to the topic. Atari Computers have got
a user base of programmers who need to support each other on the usenet on
a more global scale, and it should also help third party developers for
atari development tools read and see what programmers use/require/want.

comp.sys.atari.programmer Final Vote Ack

Voted Yes

4343. MagiC and ICD FAST hard drives

Newsgroup: comp.sys.atari.st
Date: 1994-12-01 20:33:28 UTC
From: W K Hon <zd381@city.ac.uk>
Message-ID: <Pine.SOL.3.91.941201203140.1921G-100000@burngullow>
Source record: 175656

I have a problem which I am told is due to my hard disk driver being out of date. Has anyone come across similar problem in this context, is it true and if so please, please could you tell me how I can get an up to date driver?The supplier of my hard disk, First Choice Computers in Leeds, England, have been pretty unhelpful to say the least, and they are not willing to sell me a new driver even though they must have the latest version with the FAST drives they are continuing to sell!

In January I bought FAST hard drive for my Atari STFM (4Meg, TOS 2.06 upgraded). The driver is ICDBOOT v 6.2.4 (1993)

I recently got the multitasking program MagiC v 2.01. Had trouble getting it to work - wouldn't work at all, finally deleted the MAGX.INF file out of desperation and got something to happen (although it recognised some - not all - partitions as RAMdisks rather than hard drive partitions!); managed to multitask a few programs, seemed to work OK. Saved new INF file, tried to edit it insert some of missing lines from the default INF file, MagiC wouldn't load at all using the edited version. Back to new unedited version, it worked (but won't of course allow me access to many features of MagiC because of missing lines in the INF file!).

Contacted my MagiC supplier, Atari Workshop/System Solutions. They said it was a coincidence/luck that I managed to get anything to happen by trying to load it without any INF file at all, but particularly as some partitions treated as RAMdisks, it must be due to out of date driver. They also said it was risky to continue to try to use MagiC in the circumstances I mentioned. Having had no luck with my hard drive supplier, I'm uncertain what to do next. I don't want to pay 50 pounds for ICD Professional Utilities just to get the new driver (which might not even do the trick at that, I just don't know). I'm more than happy to pay for just the driver, if anyone will sell me it. Does anyone have any thoughts on whether it really is the driver which is the problem, if not any possible solutions?

Can anyone please help me or suggest someone who could? I'm rather at my wit's end now in relation to this, and I'd really appreciate an answer in the next 2 weeks if possible as I only have access to this Internet account through a course, which finishes then. My email address until then is zd381@city.ac.uk

Many thanks

Kuan Hon

4344. customer SERVICE "?"

Newsgroup: comp.sys.atari.st
Date: 1994-12-01 20:38:01 UTC
From: damms002@acpub.duke.edu
Message-ID: <3blc79$9t@news.duke.edu>

Customer service; just a bad joke

Isn't it always the same ?

New hardware, software or other goodies announced.
You try to get information from the company advertising.
You send e-mail.
You send fax once, twice ore at least 3 times.
======> nothing happens !

What's up with old fashion customer "service" ? Why do so many companies in
the computer buisness drive theire customers mad.

All power tyo the user. Lets share bad experiences with those companies
and let's fokus our support to those companies who are worth to be
supported.

How's about a news group "comp.sys.atari.st.trouble"

May be, knowing the bad reputation of some companies might prevent some
of us from big trouble.

T. Damms

4345. R.O.M. out of buisness ?

Newsgroup: comp.sys.atari.st
Date: 1994-12-01 20:44:10 UTC
From: damms002@acpub.duke.edu
Message-ID: <3blciq$9t@news.duke.edu>
Source record: 175654

I tried to reach R.O.M. several times within the past 2 weeks
to get information on the upgrade from NVDI 2.5 to 3.0

Even after 4 faxes I didn't get any answer. The fax is, however, still
connected.

What's going on in good old Germany. Is R.O.M. out of buisness ore are
they just too buisy to make some more money by selling NDVI 3.0 ?

4346. upgrade NVDI 2.5 => 3.0 ?

Newsgroup: comp.sys.atari.st
Date: 1994-12-01 20:46:33 UTC
From: damms002@acpub.duke.edu
Message-ID: <3blcn9$9t@news.duke.edu>
Source record: 175655

Doese anybody know, whther an upgrade from NVDI 2.5. to 3.0 is
basically possible, where to get ist and how much it is ?

Chris,

a brandnew 2 Meg TT costs around 1200 U$D with no harddrive, I am
not sure how to add this all up but let me make a few corrections here
if you like :)

>>TT030, 2M ST RAM, no disk = ~$1500 US isn't it? - 1,200 U$D
>>ET-4000-based graphics card = ~$ 800 US - 399 U$D (NOVA Board)
>>17" Sony Trinitron monitor = ~$ 900 US - 700 for MCE
>>8M TT RAM + SIMM adapter = ~$1000 US - uh that I am not sure
but using the Gesoft
board you pay regular
SIMM prices of 42-45 U$D
per Meg. about 300-400
for board and 380 for simm
>>400M SCSI external disk = ~$ 600 US Uh..well no internal
SCSI these days are for
300 UD for 405 meg or
even cheaper
>> ------
>>Total ~$4800 US = ~$6240 Cdn
>

What this totals up to me is:

3,379 U$D (make that abou 3,400 for a nice
round estimate) which pretty much
compares to what Julian here estimated.

>Where did you get these prices?
>
>In Germany this amounts to ~ 2000 DM + 600 DM + 1500 DM + 1000 DM + 600 DM
>= ~ $3600 US (where I'm not sure about the RAM prices).

On the other hand Chris, a brandew Medusa System with 8 Megs of RAM and
450 Meg Internal Harddrive (and a faster processor) is around 3,400 U$D in
the U.S.A., _without_ a monitor though.

Kind of makes you wonder though doesn't it? ;)

Cheers

>upon by the mindless throng.

Only when they act like a smartass and throw personal insults around, like
you just did ("mindless throng") and Roger always does.

Act like a grownup and you'll get some respect.

>So... which of my words am I not honest enough to stand by? If you wish to
>flame someone, at least be specific so a proper reply can be made, OK?

Funny you should say that.

>< Smiley deleted for the humor (and reality) impaired. >

Another flamebait?

Hutch, I'll say this one last time. I think we all know the truth about Atari's
situation, we just don't like to have it showed down our throats from people
like you and Roger everytime these discussions pop up (cause they will)
together with a bunch of insults. You only get what you deserve in reply.

I have only ever used a kill file twice and the first one was for sinclap and
the second for Roger. I hope I don't have to use it again. I don't think you
really belong in that company, or do you?

Alfred,

the 4000 Dm price includes what kind of specs, I would be very
interested in knowing about that.

>
>Now, that sounds interesting. I'm not quite up to date on DM/Sterling exchange
>rate, but that does sound a more competitive price than the Medusa for
>a comparable performance. A low cost clone doesn't really affect me though,
>'coz I've got a falcon already.....
>

Chris,

I am also not quie up to date re: pounds and Dm but 4000 DM in
U$D translates to "roughly" 3,000 U$D or so, but without knowing what is
in that package (other than a 68030 later to be upgraded???) is a little
vague at best, especially re: the controversy of the past with the fabled
Eagle and the fact that it is about oh so a year later.

The Medusa is costing in the U.S.A. 3,300-3,400 with 450 Meg IDE
and 8 Megs RAM, Diskdrive(HDD), keyboard tower etc.

Cheers

Yat

I've been saving up the cash to buy a Falcon, but am now having second thoughts - I may find a TT more usefull. I intended to use the Falcon for Graphics(Illustrations, Video) and DTP, but from what I've heard the I may need the power of a TT for something like say DA's Repro and CalamusSL. I am not clear on the relative power, number of colours, etc when comparing these two machines.
Does anyone out there use either of these machines for graphics at a high end level, or have experience with either (preferably both :>) and could help me out here? Thanks/merci
-ken

PS I hope I'm posting in the right group, this wouldn't go into advocacy, would it?

4351. STE for sale

Hi all,

I have a 2mb STE for sale. It slices, it dices, it does mounds and mounds of julienne fries. But wait, that's not all. You get a 20mb external hard drive too. And it really really works! But WAIT, that's STILL not all! If you act right now I'll include a mountain of software! There's 3 word processors, 2 DTP's (Timeworks and Calamus!) and games, games, GAMES! AND THAT"S STILL NOT ALL! You will also get 2 joysticks, cables and a PRINTER!!!!

Now what do you think you'd pay for such a deal? $1,000.00? $700.00? $500.00?

NO!

You get it all for $350.00!! That's right! $350.00! And, for the first to reply, you get all of my ST Format and all ST related books and magazines! ABSOLUTELY FREE! Note now, don't delay.

Please respond by noting me at the above address.

Wel, I just recently bought a 85Meg MFM hard drive for $40, host card and
cable I already had, and a PC-box w/power supply for $50, and I was (or my
nephews were) in business. Trouble is, MFM and RLL is such OLD tech that it's
iffy as to how long the drives will last, still, used drives are cheap! Have
fun et Bonne chance
Thanks/merci

> and use other programes and same thing happens again.

This is the GST Shifter hardware bug. Basically, you either need a different shifter chip, or you need to make some modifications to the motherboard. I had my MegaSTE shifter fixed by Atari a few months ago (they did it for free, as a warantee repair, even though the machine is many years old).

My understanding is that you can usually just take a shifter chip from a 1040STE and it will fix the problem (and, the 1040STE will work just fine with the other chip, only the MegaSTE had the problem with the older ones).

> And problem with color graphics? Well it looks like your scolling whole
> picture one pixel left and after that one right, sometimes rapidly. Also
> Photochrome (8 MHz no cache) have some lines blinking in top and low border.
> And again 1040 STE works fine with same config.

I believe this is a bug in TOS 2.05, which is fixed in TOS 2.06. Look in the /Ste/Mega directory on atari.archive. There is a small patch for this problem, plus some text that explains it in better detail.

> In "Chips 'n Chips" (a file list of chips for ST/STE/TT/FALCON) I found that
> Mega STE`s has got two kinds of GST-Shifter chips. Mine is C301712-001
> and one WITHOUT sound problems (they say) is C300588-001. Buuuuuu.....

I could never get firm information about which chips were good and which were bad. The MegaSTE service manual states "The 74Ls02 (refering to the schematic) was added to fix the sound data hold problem which occurs with ST-4117 (shifters) older than REV. D". The problem is how to find out what chips are older than REV. D! I could not get Atari to tell me, and nobody else seemed to know. In my case, this was OK because they offered to just fix it for free.

Good luck! If you have a friend (a good friend) with a 1040STE, try swapping shifter chips. You will need a PLCC extraction tool (they are pretty cheap) to do it right. There is no risk involved if you use the correct tool.

>I know of a person that is selling his Falcon because of this, well STOS
>does not Run on a Falcon or STOS does not support the Falcon modes..??

I'm sorry to hear that, as now I have STOS running very well on the
Falcon. The problem was a fix that bugged the boot program. Put an old
copy (non fixed) through STOSFX3.PRG and now it works wonderfully.
Programmes now fly as does compiling. Of course you don't get Falcon
screen modes support and programmes must be run from an ST resolution, but
at least some life is added to the programmes and routines I've written on
the old ST.

If your friend wants a copy of the fix and you can't find it let me know
and I'll email it to you - seems a silly reason to get rid of his
Falcon........ now if it was because of a lack of games, then it's a
different story.

There was also a prototype Barracuda at ProTos, the developer gave the
impression that it was now finished, and should be available about the end
of December.

The Afterburner is not as advanced at the moment, however this may change
since GE-Soft are now participating in the development.

>Did it run on a falcon ? Magic looks great, but without f030 support

>more expensive.

CPU-wise, yes. But this is the big scam with DOS/Windows. My 90MHz Pentium
suffers badly from DOS's poor filehandling, making it no faster in real terms
than a 486sx25. However, run Linux under it, and those problems go away,
and you see the next problem layer - the IO/Bus. Mine is a PCI SCSI bus,
and it is still far far inferior to the IO that a Sparcstation can do.

CPU-speed is irrelevant on a DOS/Windows box. The disk caching is brain dead
when compared to a unix system.

BTW, Atari's GEMDOS uses the same file model as DOS.

>Intel says, "Registers... who needs 'em!"

This is true. It is an absolute JOKE that the Pentium still has the same
register set as a 386. The 68000 instruction set looks like RISC compared
to the 80x86's! Not to mention that the 80x86 instruction set is completely
based on 8-bit. I had to look at some Intel machine code, and it gave me
the creeps - I'm amazed they can get it to run so fast. The Pentium has
GOT to be the last of this line. Next chip should be all RISC with an
on-chip 80x86 emulator - it is all they can do now, surely.

>CD-ROM player, and some networking stuff that never made it, you have
>quite an array of hardware projects that were produced.

Please don't count Mega 2 and Mega 4 as different projects :-) I doubt
that Book and Pad development started before the release of the Stacy.
Stacy didn't have a different TOS than other machines. GDOS in 1989
was not very different from GDOS in 1985.

>When you consider than Atari had a staff of about 12 people working on

I would think that 12 persons are enough, considering the projects they
had to work on. Take the NVDI and MagiC people (3), add someone for a
desktop, someone for harddisk drivers, someone for XControl... You get
the picture :-)

>
> Chris.
>
>

RUBBISH! The death of Obsession will only happen with the ultimate death of the STE! Alright so Obsession is like Pinball Dreams, but certainly not a "poor mans Pinball Dreams". And anyway, Pinball Dreams is NOT out for the STE.
The real thing that I like about Obsession is simply what is achieves. TThe superb stereo sampled music, and excellent sound effects, it's excellent graphics (there's definitely more than 16 meagre colours on that game!), it's use of hardware scrolling. For years STE owners have been promised a game which takes advantage of the machines extra power, but we have never had it until now. Sleepwalker was a total let-down, and we have had to put up with cheap (though often good) PD STE stuff. Obsession's achievement puts it much higher than Pinball Dreams. With the Amiga, the great graphics are already there in the machine, with 32 colours on screen in its most basic mode. Also, the sound is much better on an Amiga than it is on an ST. So, in my eyes, ten times more hard work went into Obsession than into Pinball Dreams, and it damn well shows.

Cheers,

Dave.

>
>Luckily for the PC industry, the Pentium is pretty fast, despite the
>crippling it's received at the hands of Microsoft.

Chris my REALLY REALLY smart friend,

First of all, as I'm the author of PC Xformer 3.0, who in hell do you
think you are telling other people what PC Xformer can or cannot
run on???? I wrote the damn thing. I know what it runs on. I know
how I wrote it. PC Xformer 3.0 and Gemulator 3.0 both use 32-bit
386 code, so they do require a 386, 486 or Pentium to run on, and
yes, they run just fine on OS/2 and NT. Even OS/2 Warp and Windows 95.
Ooooh, what a concept: MS-DOS compatible operating systems running
32-bit MS-DOS code. According to you it's impossible. I would suggest
you shut up and maybe read a book on computers so you actually
understand what you're talking about. You obviously don't know
squat about microprocessors or operating systems.

Your comment about "put 32 or 64 registers on the Pentium and
you'll have a REALLY REALLY fast chip". Again, you don't have a clue.
Tell me something. I have an 80 Mhz PowerMac and I have a 90 Mhz
Pentium. The PowerMac has a PowerPC chip on it with 32 32-bit registers
in it compared to the Pentium's 8. (not counting program counter and
other such registers). The PowerPC also has 32 floating point registers.
According to your logic the PowerMac should be orders of magnitude
faster than the Pentium (I take it that's what "REALLY REALLY FAST"
means). In reality, they're fairly close. If you run the PowerMac
which is emulating a 680x0 based Mac, you'll see it runs about
the speed of a fast 68030. If yo run Gemulator on the Pentium

you'll see it runs about the speed of, you guessed it, a fast 68030.
(Actually, it runs just about the speed of a 32 Mhz TT).

So once again you've proven that you know squat, but are capable
of typing the word "really" several times in capital letters. oooh.
As you'll learn when you read a book or two, the number of registers
in a processor is just one of many factors that determines
overall speed.

Your final comment has me most interested. You obviously know more
about Microsoft than I do, and I work here! I was not aware that
we had a "Cripple the Pentium" department in the company. Are they
in building 3 or building 4? I recently moved to the "port Windows
to the 130XE" department so I must not be up to date with what
other people are doing in the company.

Please humor me and explain to me how my co-workers are responsible
for crippling the Pentium. This I have to hear. Ok, Chris, I'm
all ears.

>of hard-drive space, when we've got programs like Geneva & Neodesk,
>which I know are not the same thing, but can be stuffed onto a
>single 720K floppy collectively.

Tell me something. Are you saying that the 720K floppy with
Geneva and Neodesk gives you the same functionality as the
10 meg of space occupied by "Windoze"? Let's see, when I
compare apples and apples, I get on the 720K disk something
that is essentially a desktop program! It lets me open up
drive icons, run a program, switch between programs. Ooooh.
I'd say the 10 megabyte Windoze installation does a bit more.
Why don't you compare apples and apples? The 10 meg Windows
installation contains a lot of help files, a lot of Truetype
fonts, a lot of sample programs like the clock and games,
and a lot of other junk that isn't stritly part of the
operating system. When you strip out all that junk, you
end up with about a 2 meg installation that still boots and
runs Windows. surprise, surprise. When you take your 720K
Neodesk and Geneva installation and add in SpeedoGDOS,
and a hard disk driver, and a monitor driver, and the
whole bunch of AUTO folder programs people use to fix
all the bugs in TOS, you end up with a lot more than just
720K. Better yet, just go and install MultiTOS, which
also installs a bunch of fonts and sample programs and
other junk, and soon you'll find that yo can barely even
run anything on a 4 meg ST, that it's dog slow, and
sucks up several megabytes of disk space. So I can
make the same argument about Atari's MultiTOS as yo
make about Windows. Apples and apples, not apples and
oranges. If you just want a graphical shell that
shows disk directories and runs programs, run MS-DOS
with the DOSSHELL program, and presto, you're running
from a 720K floppy, just like Geneva and Neodesk.
Ooooh, what a concept.

Where can I find this? Is it only available to registered users?

The million dollar question: Can it run Epic?
(I know the game compatibility chart claims that Epic runs with an older
version of Backwards, but that is not true, unfortunately.)

>> How about on the TT? On mine, it starts to read the disk, runs half the
>> demo "bunker shot", and then locks :(
>
>That's exactly how my Falcon behaves without Backward!!

I released a Falcon fix for Golf some time back, which I think would work
on the TT as well. Since I never got any feedback on it (and haven't had
time to play Golf myself) the animation timing problems never got fixed.

How is the power meter speed with the new Backwards? I'm ranked #1, but
with my fix applied I got a score of 30+ over par. :-(
The power meter was _fast_.

If anyone would like to try my patch, please email.

>It might also be some problem with the sound in that scene!!

>
>The ST/STE had some nasty possibilities of using strange addresses when using
>the sound chip, that, AFAIK, is missing on the Falcon.

That is not the problem with MicroProse Golf. As I remember it, the crashes
were caused by the differences between the exception stack frames of the
'030 and the '000.
Some routines were called as both subroutines and interrupt handlers...

I wonder how Backwards can fix that. I wouldn't have thought it possible
at all. Perhaps it includes specific patches for certain programs.

The Mac is not any solution for Falcon users - most of Falcons are in
D2D-use, and a lot of it's appeal comes from the inbuilt DSP and ability
to play 16 channels of audio without external cards. Not to mention
DSP-graphics (eg. displays 0.5 Mb GIF:s in 7 seconds!).

There's no Mac that can do that kind of Audio with MagicMAC, or even
with System 7.

It's better to keep waiting for the C-LAB's audio-Falcon...

The "rumour" is absolutely true. The machine was up and running at the Pro
TOS fair in Bonn-Hennef, Germany. It faetures in the beginning a 68030
processor, that will be replaced by a 68040 at no cost later. The CPU is
on a board, so upgrading is very simple. It has at least 8 espansion slots
(12 optional), has a ET4000 graphics chip on the main bord and is TT
compatible, i.e. it has SCSI, FastRAM up to 256 Mb etc....
The machine costs at about DM 4000, with the 68040.
Again, the machine was there running atari software, I - and thousands of
others - saw it.

Bob Brodie (bob@goldleaf.com) wrote:

: John Townsend has already tried to tell you guys; there isn't any more
: computing development going on at Atari. He's very well connected there,
: and left under the best of terms. Why do you insist on foistering these
: rumors about another machine??
I do not know about the truth of rumours on a new Atari machine. It is a
fact, however, that Atari is currently negotiating with the organisers of
the Hannover Cebit shows to be present there at the Cebit; the Cebit
organisers say, that the nature of the Cebit makes it impossible to
display games only machines (they will not allow it) only at the Cebit.
Discussions are still continuing, Atari seems nevertheless very interested
to be present there. This is a message from the Cebit organizers, not from
Atari. The cebit organisers also stated, that they could not tell more and
if someone wanted to have more info, they should turn to Atari itsself

: And I'll still be using my Atari Computers on the homefront for a
: long time to come...
Have you heard about "Magic Mac"?
Magic Mac is fully TOS compatible operating system (well, more likely to
say MultiTOS operating system) for Atari AND Macintosh computers. At the
ProTOS show, Apple has been there and offered the Performa 475 and 630
with Magic Mac for free. I have to stress that Magic Mac is not an
emulator, but a fully written operating system.
You could very easily sell your small Atari machines and get a decent 68040
machine with color garphics and VRAM, CD ROM .....

In that sense, I do not think that we need a Milan or Atari at all.

Regards,

Alfred

: OK, guys... here's your chance to flame Bob Brodie as an anti-Atari
: radical and to oust him from the fold of the true believers.

Why should one flame at Bob? Bob stated his PERSONAl opinion without
arrogantly insulting Atari users and Atari software developers. He did not
mix up Atari products and prodcts from other companies (such as TOS and
Magic) and thus did not get himself to call these other products outdated,
while meaning the products from Atari.

: C'mon, there is nothing wrong with facing the truth concerning the
: business situation at Atari.
Agreed. But he also does not know the truth about Atari things that go on
outside Atari. Calling the existing Eagle a "mere rumour" that "never
existed" (while thousands have seen it) and probably never having heard
about or seen Magic Mac (or Magic for Atari machines) proves that. It
seems to me, that Atari and fromer Atari officials were even in good Atari
times as well as now somehow czut off or ignoring demand and development
going on in Central Europe.

: In fact, now is the time that Atari users
: can help each other the most as the level of support dwindles.

Agreed. And I think that works pretty well.

: If you choose to move on to another platform for whatever reason, then
: more power to ya. It's been fun. Good luck.

If you choose to move on to another platform do not think that development
of Atari software and operating systems have stopped. The operating system
is now available for Macs, other machines will follow. So you can continue
having fun with "atari" also if you move on.

: If you choose to keep using your Atari until Hades freezes over, that's
: cool too. Whatever works for you. It's NOT a competition, gang.

Agreed. But it will take some time till Hades feezes over the original
atari machines, and there are eagles, medusas, performas who excellently
run Atari software for the time after Atari.

Till then,

Alfred

: P.S.: And thanks go to the Brodiemeister for the 'sanity check.'

4388. editor for roland jv-80/30

I'm looking for a roland jv-80/30 editor in order to create my own sounds.Does anybody know a internet site, or an address where I could find such an editor?

Bazz

4389. "Network" under MiNT

Newsgroup: comp.sys.atari.st
Date: 1994-12-02 13:38:45 UTC
From: uel035r2a@tferi4
Message-ID: <1994Dec2.143845@tferi4>
Source record: 175508

I have two STs: 520 and Mega2. I would like to connect these machines somehow, so that 520ST would run like a terminal and Mega 2 would do all the job for both.

1. Is it possible to do it under MiNT?
If yes, how? RS232, MIDI, ...?

2. Can I run more GEM applications at once under MiNT? I have downloaded kernel and TOSwin and I can run only TOS programs.

3. If yes(2), can I run GEM application on "terminal" (=520ST), ie will I get the results on "terminal" screen?

Any tips would be appreciated.
Thank you in advance

The software at Demon is the KA9Q based software that you are talking about
but it's not all that confusing really. Ftp to ftp.demon.co.uk and it's in
the pub/atari folder called stnet110.tos or something.

If you want to DTP in color, then you might get into trouble with the Falcon if you need
to work on images of a few MB. The Falcon is expandable up to 14MB, the TT as far as I know
up to 256MB.
I have a TT with 10MB currently on my own, and can loan a Falcon from a friend of mine.
Second is the VME-Bus, where you can plug in excellent Graphics-Cards, like the
TC1208E from Matrix, it is, so do I think, the best at the moment.
The calculating power is also with the TT, 68030 and 68882 at 32 MHz, although
the Falcon could have this too, say with the SKUNK32 and a FPU as add ons.
I bought my TT for the RAM and for the separate Keyboard. And my friend
bought his Falcon for the sounds subsystem and the flexible Graphics interface.

Hope this eases your decision.
Bye

From: jondinga@io.org
Message-ID: <3bnac4$fj@ionews.io.org>
Source record: 175560

It's now 07:22:14 and I'm thinking about Janus ISA card

Has CGS Computerbild actually released this item? Does
anyone here seen it use/ use it? Does it use a square socketed 68000
chip .... more than one version of TOS installable/switchable? Would
it be possible to mount a accelerator on this card? Will it work in a OS/2
environment? 1024x768 res if the ISA graphics card supports it? Does NVDI
ET4000 work/help like it does with a CrazyDots?

The reasons I need to know are: my MSTE mb is dead [actually I now have
two dead mbs ;( ], I may finally have a job, but need to use a [UGH] 80486,
so a Janus sounds like a good possibility !!

CGS phone # is 081-679-7307 if anyone would like to talk to them, or
maybe someone has their email address?

adTHANKSvance...... Jon

Source record: 175556
Cross-posted to:
misc.forsale.computers.pc-specific.misc,misc.forsale.computers.workstation,misc.forsale.computers.other,comp.sys.atari.st

Adaptec 4070 host adaptor board for sale.

This board connects to any SCSI bus and allows you to use your old
ST506/512 drives (the kind you had _before_ IDE or SCSI) to your
SCSI system. You can bring back your old drive. It will happily
co-exist with other SCSI and IDE drives in your system.

The board supports two ST506 drives and can be set to any SCSI address.
It takes standard 20 and 34 pin connectors for the drives and a standard
50-pin header for the SCSI cable. The power connector the same
4-pin plug hard drives use.

This very useful board is out of production and can be quite difficult
to find.

Price: $80 or best offer
Guaranteed against DOA.

Reason for selling: I got a SCSI native drive.

Time to seriously think about buying another machine. The last
of the ST mags is on its last legs; it will phase out when support for the ST
is well and truly washed up. I imagine shareware and PD to keep going
on for a little longer though.

Whoa, hold on there, Alfred. I think you missed my intended sarcasm here.
^^^^^^^
I was simply pointing out that I expected multiple bozos to start flaming
Bob for sharing his opinion and enlightened point of view with us. As has
been proven yet again today, truth and honesty gets one flamed in this
newsgroup.

> But he also does not know the truth about Atari things that go on
> outside Atari. Calling the existing Eagle a "mere rumour" that "never
> existed" (while thousands have seen it) [...]

No, I think you misunderstood again. What he was doing was denying any
knowledge of any new computer development from -within- Atari; not what
3rd party manufacturers were doing.

> It seems to me, that Atari and fromer Atari officials were even in
> good Atari times as well as now somehow czut off or ignoring demand
> and development going on in Central Europe.

They made lots of mistakes, true, but ignoring Europe was not one of
them, IMHO, as that was the ONLY place they were making a profit for
quite a long while. Of course, now they just ignore -everyone-. :)

> But it will take some time till Hades feezes over the original
> atari machines, and there are eagles, medusas, performas who excellently

Uh, yeah, that was exactly my point. Perhaps my intent is getting
confused in the translation???

Bottom line... We can and will enjoy our Atari machines long into the
future, regardless of the existence of Atari Corp. Whether or not we
can do that without attacking each other when one attempts to share
an honest, truthful opinion is still under debate, however. ;-)

Cheers,

-Hutch- @ Fair Dinkum Tech

If DTP and Video/Image processing is you main area: get a TT, Medusa or Eagle
with a good VME graphics card.

Falcon is at it's best in everything that needs DSP (mainly music), and there
are not yet any good graphics card available for it. If Falcon would be
accelerated with Mighty Sonic or similar, it would have performance equal to
TT. Only thing missing is professional graphic displaying capabilities.

Aside that, TT is missing much of the entertaiment stuff in the Atari world,
also if (as it seems) Falcon's DSP is utilized more in programs it might get
also past the TT:s speed (in specific tasks like opening pictures).
Examples: MPEG-video playing and JPEG & GIF loading (TurboGIF can open 256-
colour 0.5 Mb Gif to screen in 8 seconds, including load times!).

For serious video stuff: there are VME cards that surpass every other cards,
but those are very expensive (but you can get 4 different videos running in
Calamus SL:s frames for realtime video frame grabbing).

Go figure...

>you just did ("mindless throng") and Roger always does.

Oh, come now, Patrik. Is that comment really necessary? You call -me- a 'smartass' and then accuse me of personal insults? My comment about the 'mindless throng' was completely generic and did not reference you or any of your previous posts at all. That was entirely YOUR choice, mate.

>Act like a grownup and you'll get some respect.

Oh, right. The computer student stoops to vulgarity by calling me a 'smartass' and suggests that -I- act like a grownup.

> I think we all know the truth about Atari's situation, we just don't like
> to have it showed down our throats from people like you and Roger everytime
> these discussions pop up (cause they will) together with a bunch of insults.

Well, I hardly think my comments qualified as shoving it down your throat. If you recall, all I was doing was coming to the defense of two individuals (John and Bob) whom I hold in great respect. They shared some personal opinion and professional insight from an inside-Atari point of view. They did NOT attack Atari users in any way, shape or form. And for that, they get jumped on??? Sorry, I just don't think that (or THIS) is fair).

>I have only ever used a kill file twice and the first one was for sinclap and
>the second for Roger. I hope I don't have to use it again. I don't think you
>really belong in that company, or do you?

You do what you want to do, Patrik. It's your choice. <sigh>

: would it?

No, this is the right group...

Since you plan on doing Video, I would recommend a Falcon. I can do up
to 65k colors while the TT without a Video card is limited to 256colors.

If you need some extra speed for DA or Calamus.... you can get some of the
accellerators that are out one the market. Like the Power-Up (cheap but not
much of speedup), Speed Res Card (more flex. and a little harder to install),
or Mighty sonic(same as power-up, but includes TT Ram.unpopulated) or
maybe even an 040 board that sould be out soon...

All in all, I think that a sped up Falcon would give you the raw power you
were looking for in a TT and all the colors and the (DSP chip) that help
speed up lots of programs like APEX to the tune faster than a 486 66DX2.

Vince

Sometimes only the rectifier went belly-up or one of the capacitors is
leaking (they dry-out during the years).

>Try measuring at different points with a voltmeter with the power supply

Be careful with that! There are some pretty high voltages on some parts of the
PSU. And some models *do not work* without a load connected to them, they
might even blow up completely when you operate them without a minimum load.

But this really depends on the model you have. (The high voltage is on all of
'em, so watch yourselves!)

Well, I did. The mail bounced. Talk to your postmaster or sysadmin to get
things sorted out. And send me email then.

To answer your question: TT-high (1280 x 960) requires an ECL input at the
monitor. There aren't that many models around which provide this. EIZO had at
least one model, but that was way above the 15"-range you mentioned.

Have a look into the current issue of the ST-Computer and call a couple of
Atari-dealers. They might provide you with some solution.

HTH!

>use the drive (unless someone already has done so). In other
>words, it's probably not worth bothering with.

Yes, 32mhz is correct for ED mode.(HD 16 and DD 8mhz).

There are a couple of kits available (at least here in Germany) which provide
all the necessary material to fit an ED-drive to your system.

Formatting-software is available as well. Perhaps you might want to contact

MW electronic
Heisterbacher Strasse 96
D-53639 Koenigswinter

Fon +49-2223-1567
Fax +49-2223-26982

they've got all you need.

Can anyone tell me how much ED-disks are? I haven't seen those babies at the
usual places. The idea of having 2.88 (or even more) megs on a floppy disk
sounds kinda nice. But I can hardly imagine some real advantages of this. Them
ED-disks are probably too expensive.

Both versions are _about_ the same in screen acceleration. But NVDI 3.01 had a couple (about 60) of TTF's and Speedo-fonts active.

Although I do not think that a benchmark is such a good indicator for a machines overall performance. It's just too dependent on e. g. caches or the compiler used for it.

As I have no Speedo5 (and I'm most certainly not going to buy one ;-) I cannot give you some 'real-life` comparison between those two.

Printing speed has improved as well compared to other GDOSses. Until know NVDI 3.01 worked perfectly stable, no crashes at all. Compare that to the problems COPMO's Speedo has and judge for yourselves.

In my previous post I forgot to mention that NVDI 3 is not a clone at all.
NVDI came with a GDOS right from the beginning.

Both NVDI 3 and SpeedoGDOS 5 use the *Speedo Scaling-Technology* from /Bitstream/.

Huh?

The standard TV-resolution (PAL) is 768 x 576 with 25 frames/second. That
cannot be the reason. Some TV's do not synchronize to 60hz, that's very
likely to cause some problems.

>worked for them?

I don't know a lot about it, as I've never done it, but a friend of
mine did put a 1.44 meg floppy into his 1040 to replace his defective
internal drive.

It worked fine except for setting a few jumpers and sawing a bit at the
frame to accomodate the new eject button (it wouldn't fit right.)

Although this sort of thing tends to void your warrantee, it can be
done. However, I'd probably let a shop do it.

Keep in mind that you will not be able to use the 1.44 floppy in high-
density. You'll only be able to access the standard 720k (as well as
extended track) formats. There are commercial products out there that
will replace the floppy controller in your ST with one that can use a
1.44meg floppy drive, so you can use the big disks.

>A GOOD Choice!

To say the least. I couldn't work without NVDI. Version 3 gives you the speed
of prior versions *plus* excellent TrueType- and Speedofont-handling

>>I'm very intringued by Magic that seems to be a TOS replacement promising,
>>other than multitasking, more speed too.
>1. They work very fine together!

They ought to as they come from the same group of programmers.

>>what Magic will speed up ?
>Magic Speeds up the AES-Functions (i think so) and all GEMDOS-Routines
>With Magic you can faster work with you ST. And that WITH Multitasking.

Mag!C improves the overall performance of your machine. Disk and harddisk
access, screen redraws, and yet it is a fully-featured *preemptive* multitasking
OS. *Way* faster than MultiTOS and _much_ more stable.

There is one tiny exception to this. In *Nuremberg* MultiTOS runs faster than
light and is more stable than Mag!X. But that's a completely different story and
somewhat an /insider/ joke if you will ;-) All the German MausNetters probably
know what I'm talking about ...

Later guys!

I know the first version of Starball had a problem with computers which have
more than 4 Mb.
On my TT (8 Mb) I was obliged to use ADEBOG to run Starball. A friend had the
same problem on its Falcon 14 Mb.

Now the version 1.61 of Starball works very well with 8 Mb TT and 14 Mb Falcon.

f > SpeedoGDOS. So you have to have speedo installed first.

Atariworks uses Speedo, but only need Gdos to print. When you run Works
without Gdos, it leaves a message like "Gdos not installed, graphics fonts and
print not available". Sure it's better with Speedo, but only Gdos is needed.
Nothing to install in Works. The driver is installed during boot by Gdos,
Speedo or NVDI.

4427. HELP ! lost data

Newsgroup: comp.sys.atari.st
Date: 1994-12-02 22:05:46 UTC
From: damms002@acpub.duke.edu
Message-ID: <3bo5nq$809@news.duke.edu>
Source record: 175577

I accidentally deleted a few files from a floppy which I still
need ! I tried to recover these files using an old programm
called "D-RETER.PRG" but this program doesen't work on my TT.

Is there any programm available at an ftp site for undeleting files ?

>requirments to get the st to recognise the blitter.. I installed a 68 pin

Yes there's a jumper right by the blitter chip marked W4 I think you
just remove the solder blob on it to enable the blitter chip.

My memory is hazy over this as it's quite a few years since I fitted mine
somebody here will no doubt correct me if i'm wrong.

4429. Finding upoint

Newsgroup: comp.sys.atari.st
Date: 1994-12-02 23:12:22 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <ELDLFGUUUp@stingray.manawatu.gen.nz>
Source record: 175582
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Can anyone please tell me where I can get the August 13 version of upoint_l.lzh (upoint uucp proggie). I have tried several places but to no avail. I can't use ftp easily (I have to ask a friend, who asks a friend...) and so if I could locate the correct version, then I could just get it from a mail-server.

I have tried tu-berlin, tu-clausthal, but they only have the July 26 version.

I'd _really_ appreciate some1 telling me I could get it from please

Richard.

>>understatement.

STR was by far the best magazine for the Atari machine, were as ST Format has
been
a liability to the machine IMHO. Hope all was well with the Atari Machine until
this happened now we have a problem with the lack of support of competition
which has kept the Atari market buzing for a long time.

Hope STF picks up its editorial style but we have to live with it. but STF
wish to control a small market with domination through MONEY.

Write to STF to demand the best.

Phineas

Most of the stuff that makes silly assumptions is DOS software; if I had
a PC it'd be running Linux or OS/2 (probably just Linux).

>2) Cost. IDE drives are dirt cheap so you might as well have one for all
>the boring system files.

True, true.

>Actually point 2 is the problem. IDE drives are *so* cheap that you can't
>buy a small one anymore. The price difference between a medium (200Mb) and
>a large (540Mb) is only about 50ukp. Needless to say I ended up with the
>larger of the 2. Hard disk space is always useful - even if it is 'slow'
>10ms IDE disk space ;-)

I'm waiting for someone to follow a bright idea somebody posted to a net
a year or so ago... Small, VERY fast drives, like 64M or smaller, but
incredibly fast access and transfer rates... what for? Swap space!

>The interfaces are cheaper as well. A SCSI card is 50ukp - 200ukp, whereas
>an IDE one is about 10ukp and its often combined with the IO card.

It's worth the price though. Unfortunately, most PC owners just go for
whatever is cheaper, they don't really care about quality or capability.

> > And, gee, you've still got that IDE disk. Sure hope you don't want
> > to add a DAT and a CD-ROM... And then there's the other liability
>
>Whats the big problem adding a DAT and CD-ROM to an IDE system? My SCSI
>CD-ROM co-exists quite happily with my IDE drive.

Well, most people go like this:

1) buy PC with IDE drive
2) buy CD-ROM with its own card
3) buy sound-card
4) oops, no way to backup... buy weird tape drive with its own card...
oops, no free IRQs or IObase to put it at! Damn...

Now, if they'd just bought a SCSI system, adding the CD and the tape
backup (and another hard drive or two or three and a SCSI Ethernet

interface) would've been VERY easy and painless.

The great thing about SCSI is that it gives you excellent expandibility
for a low cost. PC owners don't like it because it doesn't have slots,
and as far as they know, if it doesn't have slots, it's not expandible.
:-)

Much to the annoyance of people who think that the entire PC community
hates to have anything done on a non-PC, Doom was developed on Intel
hardware running NextStep for Intel. They did it that way because
NextStep is a real OS. (says Tim, former 1040STe owner and now a Mac
Quadra 660AV owner.)

Hmmm... lessee, my Mac seems to have a 55 MHz DSP on the motherboard. Oh, and it happens to have 16-bit 48 KHz sound digitizing and playback too. Multiple channel playback? No problem, directly supported by the OS (which is not the case on the Falcon - you have to make your own routines!).

> Not to mention
> DSP-graphics (eg. displays 0.5 Mb GIF:s in 7 seconds!).

Ooooh! My computer, without using anything other than its 68040 (running at 32 MHz), displays a 530 KB GIF in about 7 seconds too!

From: rkim@uranus.uucp
Message-ID: <3bp9rr$s83@nic-nac.CSU.net>
Source record: 175513

I need a few people to test out some switches that I've acquired. These switches are practically an exact match for those found in the ST mouse. The only difference from the original is that these switches have a slightly softer feel.

If you're interested, send email. If you're selected, the only charge would be shipping ($1.00). Right now, I need opinions and suggestions.

Also, advice on how to advertise this (properly) on the net would be most appreciated.

Thanks in advance,

Rich K.

Yepp, you're right (of course :-).

I didn't /really/ forget you. Im my mind you're the one who started this
whole development of new and improved OSses, with the release of KAOS 1.2.x,
in the first place. And I'm using it ever since :-)) Perhaps we should mention
Dirk Katzschke as well, shouldn't we?

Keep up the good work!

TurboGIF 1.3 is _not_ using the DSP!
I don't know why everyone seems to believe that.

>Ooooh! My computer, without using anything other than its 68040 (running
>at 32 MHz), displays a 530 KB GIF in about 7 seconds too!

And my computer with a 16MHz '030 on a 16 bit bus (yes, a Falcon030) can
display a 500kbyte GIF in 7 seconds as well, using only the '030.
You really should get a better GIF viewer!

MGIF 4.4 loads GIFs slightly faster than TurboGIF 1.3 (very slightly) but
displays them three times as quick. It's all a matter of smart coding.
A GIF viewer that used the DSP should be much faster, but I've not had
time to add that to MGIF yet.

The TT can load and display GIFs quicker than that, you only have to use
the right program. In this case that would be MGIF 4.4. ;-)

To repeat what I said in another thread a few minutes ago:

TurboGIF 1.3 is _not_ using the DSP!
I don't know why everyone seems to believe that.

MGIF 4.4 loads GIFs slightly faster than TurboGIF 1.3 (very slightly),
but displays them three times as quick. It's all a matter of smart coding.
A GIF viewer that used the DSP should be much faster, but I've not had
time to add that to MGIF yet.

>was something with the 040 Version. If I remember right
>you purchase the 040 Version jet and get a 060 when they've
>finished the card. (The Eagle works with CPU cards).

Almost right ;-)

The Eagle will be shipped with a 68030/68882 both 33mhz. This will be replaced with a 68040-card as soon as it is available.

>I guess I'll have to bring the last ST-Computer here to type
>in some more information...

Here you go:

GE-Soft claim that their /Eagle-Channel/ is capable of using cards with other CPU's e. g. Intel (yuck!) PPC etc.

8 slots are available, the RAM-board comes with standard SIMM-sockets. The TT-RAM-board can use a max. of 256mb TT and a max. of 14mb ST-RAM. The ST-RAM is arranged 32-bit wide as is the TT-RAM.

The machine comes with a VME-adaptor, so you'd be able to use those ET-4000 cards with NVDI ET-4000. GE provides a custom grafix-card with resolutions of 640 x 480 in 16 colcors and 1,280 x 960 monochrome. These resolutions are directly supported by the TOS 3.06 so you do not need a special VDI-driver.

Important note: TT-high signals come as *RGB* and _not_ as ECL like on an original TT. An adaptor RGB<>ECL will not be available from GE-Soft.

Ports: 4s/1p, ACSI, SCSI (TT-like), ROM-port, TT-keyboard as well as standard MF2 keybd. (adaptor is on the board).

The compatibility wasn't tested thoroughly yet. But all 'clean` apps should work fine.

A basic Eagle will flx to you for about 3.800,-- DM, 2.400 US$, 1.500 UKï¿½ with Case, Keybd., Mouse, 4megs.

This is roughly the information stated in the German ST-Computer. I'm not aware of any more information right now. So _do not_ ask *me* for more details!

>other samples (vocal etc). This out-price-performs the Akai DR4d
>(hard-disk based sampler). ST Review suggests that it is possible to run a
>sequencer in parallel with TDSM.

Hopefully the program will run as an accessory as well as a stand alone program,
but memory allocation is currently a problem - the program may run with a fixed
amount of sample memory when run as an accessory.

My current plan is that you would need to connect the Falcon midi out directly
to the midi in, so output from the sequencer would be played into the sound
driver... the program should hopefully be finished in a few months.

>Whatever, could you tell me more?

I will post a fuller description of what 'The Digital Sound Module' does in
the near future, however a full preview can be found in the Christmas edition
of the UK magazine 'St Review'.

>You're SOOOOOOO right... NOT! Yeah, I have to agree with you. XWING is
>just a load of crippled DOS drivel. What planet are you on? DOOM is

You obviously have NO IDEA what contortions the programmers had to go through to make XWING work, let alone work well. The Jaguar could handle XWING no problem, and it's got less computing power (though the graphics and sound processors probably blow your PC's graphics and soundcards to shreds as far as performance goes).

>shit, DOOM II is shit. Get a grip. NO game on my Atari comes close to
>anything I have on my DX2 66.

Well DOOM II is DOOM with a different WAD... big deal. I'm not saying they do come close to your Atari's games; I sure hope you didn't buy that PC just to play games.

>Jeez, you're such a dick!

Oh, I see you did and you're mad about spending 10x what it would've cost you to buy a games console (which could easily be hooked up to a large TV and a good stereo, like mine is).

>The ONLY drawback is cost! I run Word 6, Excel 5 and, yes Windows, and
>ChemWindow 3 for writing up my Ph.D. Show me a more integrated, user
>friendly system for me to use and i'll gladly change.

Try almost anything on a Mac, it'll be more integrated. Oh, I guess you can't play XWING and DOOM on a Mac, so it's a useless hunk of crap, right?

Take a look at NEXTSTEP. Sure, you can't run bloated Word 6 and Excel 5, but there are equivalets that are much, much nicer. And if they crash, the whole machine doesn't fall over... I'd imagine the equivalent of ChemWindow would run a bit faster on an HP-PA RISC workstation (you know, the newest platform NEXTSTEP will run on), given that all of the HP 9000 Series 700 workstations totally slaughter any Intel chip as far as floating-point performance is concerned... scientific computing usually uses lots of that.

>I've owned a Spectrum 48k, Amiga 500, Atari 4Mb STe (HD, mono mon etc)

>anywhere. The average PC is so much better specified than almost all Ataris
>- and while certain Ataris have certain advantages over the PC, there is
>no universal reason to favour an Atari over a PC.

Unless you want to program it and for some stupid reason you don't want
to run Linux or NEXTSTEP or something else that's useful (for ex, you
feel a need to bring home Word or whatever from work so you can work at
home at night and on weekends and it only runs under Windoze).

I just can't bring myself to downgrade my computing architecture. *ALL*
of the other computer purchases I've made have been serious upgrades in
architecture, ease-of-use, etc... Vic-20 -> C=64 -> Atari ST. I
certainly don't want to move back into the early 80s with an ISA bus or
8088-compatibility.

Not to mention the fact that a PC is disposable technology... if you buy
"top-of-the-line" components, it'll _still_ be totally out of date in
two years. Better toss that processor and buy a new one! Sheesh.

>I too got a copy for my 486 this weekend - though I had seen it being played
>a lot. True - its only a game, but I've never seen anything like that on
>my TT. Even if I could write a DOOM clone for the TT, why bother - how many
>people have a TT and would be interested?

A couple of people are writing it for the Falcon. It's already released
(in 65k colours, with smooth shading... which simply can't be done on a
PC because there's no standard for better video modes) for the Jaguar,
as is the awesome Alien vs Predator.

Sure you can tack WADs onto PC DOOM ad infinitum, but that doesn't mean
the other alternatives are no good.

>I think the main point comming out of all this PC talk is that its no
>longer a case of Atari or PC. If you stick with just an Atari you ostricise
>yourself from 90% of the current computer market. *However* just because
>you might now own a PC *doesn'* mean you are not still a dedicated Atari
>owner.

That's true.

But some of us just can't bring ourselves to follow the herd just
because it's easier. DOS/Windows users are lemmings; if you're going to
buy a PC, you should at least have the sense to put some useful

operating system on top of it.

Absolutely brilliant, STF can't beat STR in sales so they buy them out
instead, leaving us with..... STF. Oh sh!t.

ST Applications was good, until recently when it took on it's new toilet
paper look. :-(

> Well after reading here that ST-Review is now closed, well at least
> it shuts up those people that have stated here many many time how
> good Atari is doing in the UK etc..

It wasn't closed down so much as bought out by its competitor. I'm not sure how different this is from the point you're making but it certainly wasn't the case that it was closed down due to lack of popularity in itself.

I think Europress decided to sell up when the offer came in because the Atari market as a whole is in terminal decline and they thought they'd get more for it while it still had a readership than in a year's time when it would be, inevitably, halved.

> With out magazines the Atari platform is dead...

With one crap magazine (STF) it may as well be dead.

Like I said, I made them up. I'm still waiting for someone from the US
or Canada to post prices.

>In Germany this amounts to ~ 2000 DM + 600 DM + 1500 DM + 1000 DM + 600 DM
>= ~ $3600 US (where I'm not sure about the RAM prices).

That doesn't help me at all; prices in Germany (and availability for
that matter) have no relation to this side of the pond.

If found the software very hard to use; all I wanted was to send email
to the sysop... instead, I had to post a message in what appeared to be
a public forum.

I've had lots of experience with ST BBS software, some PC BBS software
(I administer a BBS at work, based on The Major BBS.. which is the
single worst piece of PC software I've ever had to use), and UNIX, and
the Michtron BBS was one of the least easy-to-use things I'd ever seen.

Hallo!

Could anybody please give me a hint, how I might contact Volker Soehnitz, the author of a virus detector on the Atari ST? I tried "normal" mail and email using the following address:

volker_soehnitz@ac.maus.de

I think that my mail has reached its destination, because I did not get it back, but I never managed to get an answer.

Thanks in advance.

Andreas

>
>I'd just like to correct a few of Chris's prices with a reality check
>from here in the U.S.:

Thank you Joan!

So, let's see what a TT setup would cost, roughly:

TT, 2M RAM 0 disk -> ~$1200 US
500M SCSI disk -> ~ 275 US (I don't believe this; best I found
was about $450 US, but that was about
$585 Cdn)
16M RAM SIMMs -> ~ 560 US
RAM adapter card -> ~ 300 US (still don't know; what does GEsoft's
TT-RAM adapter cost?)
2M VRAM video card -> ~ 800 US
External SCSI CD-ROM -> ~ 200 US (I don't believe this for EXTERNAL)
17" CTX monitor -> ~ 650 US

Total -> ~$3985 US (about $5181 Canadian; OUCH)

I still think we're a bit low on the 500M SCSI disk and the external
SCSI CD-ROM, but that's probably made up in the over-estimated RAM
adapter cost.

>> Prices are higher in Canada. If you can find someone to sell you the TT
>> or the TT video card.
>
>This may be true, but most U.S. dealers are happy to ship to Canada.

Then add high shipping, possibly some duty (I know there's none on
components, but I think there is on complete systems), and probably 7%
on top for the Grab and Squander Tax.

>You are correct in that there is a premium attached to certain aspects
>of TT systems, namely video cards (around 4x PC costs) and RAM adapter
>cards (not needed on a PC). Plus, the base system is rather pricey,
>considering what you're getting. But all the peripherals are no more
>expensive than for any other platform. In fact, they're interchange-
>able.

True, but it's the base and the premium parts that drive it way out of
reach. For the same amount of Candian cash, you can buy a Pentium or

PowerPC-based system, both of which will make the 33Mhz '030 look anemic.

I was fishing for...

>If all the prices are that inflated (guess I shaved about $1200 off
>of the ~2200 so better than 50% reduction) then you can have the
>system for <$3000. Wayne

You certainly couldn't in Canada. Tack on 30% for the exchange rate,
and then maybe another 10% or so, just because. Like I said, computer
components are more expensive up here than they have a right to be.

Message-ID: <94337.111430STIRRE31@MAINE.MAINE.EDU>
Source record: 175532

Hutch,
The person that has been talking to Insignia about releasing SoftPC
has said that they are willing to just release it into the public
domain but cannot without Atari's permission. Atari has been very
uncooperative supposedly. If Insignia is willing to release SoftPC
than why can't Atari work with them to allow this to happen? Many
users want this product and Atari doesn't give a hoot. This, IMO,
is a bad attitude. You may argue that Atari only cares about consoles
now but remember that happy Falcon owners are more likely to recommend
the Jag to friends than angry ones. Atari should support its users.
As far as e-mail, someone reads the mail directed to atari@genie.geis.com.
I have also gotten responses from Atari UK via e-mail.

>it to a.a.u.e). They don't have to market, support, or even document it.
>Cost to Atari - tiny. Benefit to Atari community - large. What have they
>got to lose?

I do see a benefit to Atari - but only they could answer if this is
really a benefit to themselves and how much its worth. If the bean
counters have taken over - forget it. They don't know how to count
such assets.

By releasing Insignia's Softwindows, there will be a few less Atarians
that may jump ship - why jump if you can taste the grass on the other
side? Now if Atari ever think they might get back into the computer
business, then every Atarian that is still around when they jump back
in is still a potential sale. I'm not sure that the same can be said
for those that jumped ship - they probably even have a negative impact
on sales trying to justify their decision to leave in the first place.

So Jack - count those Atarians that stayed on the platform in the
plus column - and the lost Atarians in your minus column - you can
bet none of those considerations will appear in your accountants
analysis. Now is it maybe worth it? Please??? Wayne

This is all rather depressing I've just spent around 900 quid on Atari
Stuff (Falcon, VGA Monitor and software) now I find out 6 months later
their is one mag, probably even less software and that Atari have NO
intentions of persuing Personal computers. Also it seems the JAG has
bombed sales wise so perhaps we wont even have Atari in existence in
a year or so.

[Apologies if it is impolite to post for sale messages to comp.sys.atari.st, but I figured the market for this item is a little narrower than what I saw on the other forsale groups].

I've got a 1040ST (which I tested three days ago and seemed to work fine), a mono monitor, a broken external floppy drive, and a bog box of goodies including several languages, a couple gadgets for generating NTSC video, and some books and magazines. I'd like to sell all three boxes, as is, for the best offer I can get. I haven't used it in several years, as I've moved firmly into the mac and unix community, and I'm sure there's some die-hard Atari user who can make better use of this than I can.

I'd also be interested to hear from other Atari users: what's this worth? As I haven't been following the Atari world for a few years, I have no idea what it's worth. I'm not looking for very much money, but I'd like to have a ballpark idea ($300? $200? $100? $10? $1?)

I'd especially like to sell it to someone in San Diego so that you can come pick it up. I don't have a car, and shipping is very inconvenient for me. But I'm willing to entertain out of state offers.

Thanks,

Scott

[...]

Don't forget that these people probably have Atari-experience and knowledge
for many, many years, probably since the first release of ATARI ST-computers.
They had to cope with many bugs and weak points of 'T'he 'O'perating 'S'ystem
and learned a lot about it, not only during the last years, while developing
alternatives. And it's always easier to learn by other ones mistakes and do
it better than doing it from scratch.

Nevertheless I don't want to diminish the work of these developers. They do
the work Atari should do. And they do it a lot better!

I always thought the maths was pretty good - then last week while I was converting it to the PC I noticed a couple of faults... (Basically if the ball hits an angled wall the ball gains quite a lot of momentum....). It takes months of refinement to get a good ball algorithm, and I'm still getting closer...

|> : > 4: "more going on" are you on drugs? Compare the graphics quality!!!
|>
|> : Well, there's more sprites in Starball compared to the demo level of Obs.
|>
|> Didn't mean to give the impression that Obsession has more 'happening' on
|> screen, just merely the fact that the graphics in obsession is timeconsuming.

Hmmm, my only comment here is graphics which can be chosen and aligned on 16-pixel backgrounds, and never move, but do change, are very fast... I could do about 40 sets of flippers on screen at once at 25Hz on an STFM, but only 32 sprites... anything which doesn't have moving sprites is 1. very boring and 2. very very easy....

One more point someone made about the ball animation being very easy - of course it is, but all animation is easy, it's just how many frames you want to use. More frames are a bad idea because 1. it's memory consuming and 2. your artist threatens to kill you. I wanted to do a properly moving ball, and calculate spin, but Andy wasn't keen on drawing the extra 56 frames....

Just my few comments. So far I'm very pleased with the amount of people who keep telling us how much more fun Starball is than Obsession, and Andy appreciates the comparisons on graphics too. Thanks all

That's right, we're alive and kicking, or, as we say in Germany,
those presumed dead live longer.
We were very busy since we also had lots of ATARI hardware to
sell (even TTs, TTM195 and Mega STe!) and we had to take care of the bits that
were left. We'll get to orders in a few days.

For the more serious Atari Users the Name Darek Mihocka is not a new name. You have come up with some 'generally' bright things in your past of which your can be very proud.

I think to point that people are trying to make Darek is this, we, you and all the others are comparing the present PC market '94-95' with that of the Atari ST dating back to 1985-86. If you bring this into the picture even a generally bright person such as yourself must agree that the ST is still a computer that knows its mowes, or if you forgot maybe you should try it again!

The other point is this, compare the ST with is't generation's equal and the picture changes quite a bit, I believe this was a PC or XT if I remember.
If a person would compare the cash expense between two people, one how bought the ST and the other who bought the XT, you would see the difference!

The point is not that you don't know better, althought we can't say the same for the company you work for, the point is you avoid the obvious.

looking forward to your reply.

These views are my own.

Ben Van Mil.

Yeah, I wonder why all Pro-sequencer/audio progs need Digidesign
cards when you want to use them on a Mac?
It's funny, I haven't programmed any routines ever, and here I am
running 16 tracks of audio combined with 128 tracks of Midi ??!!
Poltergeist?

Aaah! As it seemed the prog I have does *not* use the
DSP (my Falcon is 16 Mhz 030)...
So you get a second faster with 16 more Mhz:s and a 040? I hope you paid
less for your Mac that I paid for my Falcon :-)

Yep, I should. The viewer I was using was GIFconverter. I tried the same
picture with QuickGIF 1.0, which opened it in about 2.5 seconds.
Unfortunately, I hate the interface for QuickGIF - it has a really strange
file open dialog box that behaves in a very confusing manner.

Actually, see the previous message. I just tested the GIF viewer I normally use. Another one, despite the programmer's inability to create a decent interface, opened the same GIF in 2.5 seconds.

I bought the 660AV when I discovered it was about $500 more than the Falcon, and gave me a video digitizer, a faster CPU and DSP, actual uses for the DSP (it comes with voice recognition, and can also be a fax/modem if you buy the $100 phone line interface pod), better video modes, etc. They're not in production any more, but for a price a bit lower than what I paid for the 660AV almost a year ago, you can now get a Power Mac 6100 (PowerPC 601 at 60 MHz).

I'm having this strange problem that I haven't had before. I'll be working in my editor or my communication program and all of a sudden as I type, the characters on the screen go slower and slower, until the reaction from keypress to seeing it on the screen takes several seconds, then the machine freezes completely. It's not just the typing, but all aspects of the machine, like saving a file, getting the file selector and pressing "buttons" with the mouse takes just as long.

Could this be a virus, or is the memory too low (not enough)?
I have been using my setup for quite some time just like I do now, and I haven't had any problems until recently.
If this is a virus, which virus killer shoudl I get, and where (ftp site)?
Thanks.

Sorry Christpher, that's not correct.

NTSC uses _about_ the same resolution as PAL does (740 x 525). It works with
30 frames/second and uses a different technologie in transferring the
color information.

>>routines!).

Yes, your Mac is cool. I assume you have a Quadra 660AV or 840AV. These have the built in DSPs. Without any hardware cards, you can get up to 6 and 8 digital tracks with the Deck 2.0 sequencing/recording program. That's cool. Remember, though, that Atari created the Falcon with the pro musician in mind. Apple could care less about MIDI implementation and recording specs. A few points to consider:

1) The Falcon can do 16 tracks digital stereo with Cubase Audio. Total system price would be under $2200 list including 4MB/85 and SVGA monitor.

2) 16 tracks on PC clones or Macs will require Soundtools hardware. For the Mac, 16 tracks will cost close to $15,000. You will, of course, have an awe-inspiring, top of the line setup, however.

3) A major complaint of prospective 840AV buyers for digital recording is Apples implementation of some weak A/D convertors. There is no simple way to bypass these, and the result is a rather low S/N ratio (78db?). This is not aweful, and will do for the hobbysit . . .

But, if you want some serious recording for a very attractive price . . . you must get a Falcon, and Cubase Audio. I also think E-Magic is working on a Multitrack digital recording package for the Falcon . . .

. . . correct me if I am off on any points.

4508. New atari.archive.umich.edu mirror

Newsgroup: comp.sys.atari.st

hi folks,

just a reminder that we are now being mirrors at ftp.orst.edu, along
with the rest of the larger sections of archive.umich.edu, in
the pub/mirrors/archive.umich.edu/atari directory.

it is in your best interest to 1) use afs to get to us or 2) use
the mirror closest to you. that way, you can go on enjoying
the atari.archive.umich.edu service, and we can continue
providing it to you.

remember: you cannot upload to these mirrors. all uploads must be
sent to us here at atari.archive.umich.edu

thanks!

Don't feel slighted Roger, we have to subscribe to get it in the UK as well. I've only ever seen it on general sale in one shop and heard about it in another (Birmingham and Coventry). That was a while ago though.

> has bombed sales wise so perhaps we wont even have Atari in existence
> in a year or so.

Rod, you can read it that way if you like and to an extent it is true, but your Falcon is still the same machine that it was, the software is still coming through and the NET provides me with most of the news stories weeks and months before the mags printed it as well as NeST, Atarinet and Turbonet.

IIRC the same thing occurred in Germany earlier this year and look at the products coming out from there.

What we won't get is the run throughs on softwre comparisons and such-like, but surely STF must change to fill the gap to some extent. ST Apps is still around and who knows how they will react - perhaps they'll re-expand the mag again.

Only the magazine has been closed, not your personal machine.

If you interlace, you can get above 200 lines on a television. I was speaking
of the maximum clear resolution where you can actually discern an individual
pixel. If you push it beyond 320 x 200, every pixel blurs together. Good for
still images and even games, but 320 x 200 is the best real resolution from
a TV.

Source record: 175475

Does anyone have a Jaguar game system they want to sell?
Well, hey... doesn't hurt to ask, does it? Ya never know. :)

Alternatively, does anyone know where one could be found for
less than full retail, i.e., $250? The Jag is not available
at a discount from Atari's Developer Support Program so I must
search for other sources.

Any suggestions would be appreciated. Christmas is approaching!

And sorry for posting this here but I couldn't find a Jag topic
on my news server. If anyone knows the appropriate newsgroup
names for Jaguar related stuff, please let me know.

Many thanks,

-Hutch- @ Fair Dinkum Tech

660AV. When I bought it, the 840AV was way too expensive, but the 660 was very affordable.

Apple does seem to have a problem with supporting MIDI. One of the main problems is they lack sufficient serial ports - Macs come with two, but they really need about 4.

> 1) The Falcon can do 16 tracks digital stereo with Cubase Audio. Total
> system price would be under $2200 list including 4MB/85 and SVGA monitor.

85 MB is nothing. If you're doing digital audio editing, you can forget the wimpy HD Atari puts in the Falcon.

> the Mac, 16 tracks will cost close to $15,000. You will, of course, have
> an awe-inspiring, top of the line setup, however.

16-track recording isn't possible with the base Falcon hardware, either. There is only one stereo codec in the Falcon.

> 3) A major complaint of prospective 840AV buyers for digital recording is
> Apples implementation of some weak A/D convertors. There is no simple way

> not aweful, and will do for the hobbysit . . .

As far as I know, the Falcon has this problem too - that the built-in codec is not very good at all. For both machines, it appears that pro quality work requires add-on A/D converters, which are quite expensive.

> But, if you want some serious recording for a very attractive price . . .
> you must get a Falcon, and Cubase Audio. I also think E-Magic is working
> on a Multitrack digital recording package for the Falcon . . .

I think one of the problems with the Falcon is that it is a hobbyist computer with professional aspirations. The codec isn't up to pro specs, etc., but the DSP sound system is. It has built-in MIDI ports, but nearly

no OS support for them. (There is also not really enough OS support for digital sound.) It comes with a ridiculously small hard drive in an inconvenient form factor, so that it's more expensive to add storage than it should be. (If you buy a replacement 2.5" HD, it's more expensive than 3.5" storage. If you buy an external drive, you get the overhead of a case/PS and ACSI adapter.)

The basic problem is that Atari had to design it for the hobbyist market, so that they could sell units to their few remaining devotees, but also try for the pro sound market. I don't think they ended up with a good compromise - it's overpriced for what you get as a hobbyist, and for whatever reason, it has definitely failed to capture the hearts of the entire music industry, as has been evidenced by the ever-slipping market share of Atari in the music world.

Better look again. Current pricing on new hard drives is a little over
$.50 per megabyte in the United States, for 1 GB or smaller SCSI drives.
I recently bought a Quantum 2100 drive for $950. 500 MB SCSI drives are
generally in the range $250-300. In the past few months, drive prices
have been dropping very rapidly. Aren't price wars great? :-)

> I'm waiting for someone to follow a bright idea somebody posted to a net
> a year or so ago... Small, VERY fast drives, like 64M or smaller, but
> incredibly fast access and transfer rates... what for? Swap space!

Actually, not a very bright idea. The design tradeoffs just don't work
that way. Basically, to make the drive faster, you increase the linear
bits per inch on the tracks. That allows more data to be read in the same
amount of time. But that also increases storage! Or you could increase
the rotational speed of the platters. But that makes you redesign the
on-board electronics to handle higher data rates, which means you could
keep the same platter speed, increase data density, and have the same
speedup that you'd get by increasing the platter speed. Almost any way
you work it, increasing speed translates to increasing size as well.

Another part of the equation is that they might as well make a 200+ MB
drive as a 80 MB drive - it costs the manufacturer roughly the same amount
of money to make either one. That's why drives under 200 MB are rapidly
going out of existence as any kind of high-volume product.

Now how about this: Design extremely high-density, low-cost DRAM that has
a very slow access time - say, on the order of 500 ns. Use it for swap
space. I don't know how low-cost you could get it, though - it might
still be an impractical amount of money for a reasonably large swap space.

> >The interfaces are cheaper as well. A SCSI card is 50ukp - 200ukp, whereas
> >an IDE one is about 10ukp and its often combined with the IO card.
>
> It's worth the price though. Unfortunately, most PC owners just go for
> whatever is cheaper, they don't really care about quality or capability.

IDE is fine. It is slightly faster than SCSI for most low-end purposes -
no SCSI command and bus arbitration overhead (which add a few milliseconds
to the average access time), and the raw bus performance is roughly the
same. (Both well exceed the performance capabilities of most drives under
1 GB.) And given the number of compatability problems that many SCSI
implementations have on the PC, it's easier to use IDE.

> Well, most people go like this:
>
> 1) buy PC with IDE drive
> 2) buy CD-ROM with its own card
> 3) buy sound-card
> 4) oops, no way to backup... buy weird tape drive with its own card...

>
> Now, if they'd just bought a SCSI system, adding the CD and the tape
> backup (and another hard drive or two or three and a SCSI Ethernet
> interface) would've been VERY easy and painless.

Most people don't get a CD-ROM with its own card. They get a sound card that has a SoundBlaster type CD interface, and then buy a CD-ROM with that same interface. (Or more likely they buy it all as a big "multimedia" bundle.) Also, most tape backups sold are those of the type that use the floppy controller instead of a tape controller - slow but really cheap, no extra interface card required.

> The great thing about SCSI is that it gives you excellent expandibility
> for a low cost. PC owners don't like it because it doesn't have slots,
> and as far as they know, if it doesn't have slots, it's not expandible.
> :-)

Good thing you put in the smiley. Most PC owners don't like SCSI because it is not low-cost. A decent PC host adapter costs you $100 or more. SCSI CD-ROM drives are far more expensive than SoundBlaster or proprietary card interface drives (we're talking under $150 for double-speed SB interface drives). SCSI tape backups cost. In the IBM PC world, SCSI is not a cost-effective option for most users, and it's an option associated with incompatability problems. (For the longest time, PC SCSI implementations have not been that great.)

Now don't get me wrong. I'm of the firm opinion that 100% SCSI would be a good thing. It doesn't really cost any more to implement than IDE - the sole reason that IDE is cheaper is higher volume sales.

I like slots. I wish my computer had more of them, but Apple really reams you pricewise for getting very many slots. SCSI/IDE are OK for certain applications, but many need card interfaces.

Then don't. The ISA bus and 8088-compatability are red herrings at this
point in time. Get a Pentium with the PCI bus - it's cheap, the bus is
fast, the CPU is fast, and you can run a real OS on it (OS/2 Warp is nice
for starters). Just wait until the Pentiums without the FPDIV bug have
replaced those with in Intel's production output.

> Not to mention the fact that a PC is disposable technology... if you buy
> "top-of-the-line" components, it'll _still_ be totally out of date in
> two years. Better toss that processor and buy a new one! Sheesh.

Do you have to? No. The Atari market doesn't know about how cool it is
to have technology advancement, because it never had much. The TT was
years behind the competition and the Falcon was too little too late.
(Atari lost all hope of competing with the Mac when they failed to respond
to the Mac II for so long. By the time they got the TT out, which seems
to be a very kludged architecture in comparison, the Mac II series was a
very evolved and stable platform with lots of software written to support
its features.)

> A couple of people are writing it for the Falcon. It's already released
> (in 65k colours, with smooth shading... which simply can't be done on a

There is a standard for better video modes - VESA.

Have you seen the new Mac game, Marathon? Incredibly awesome on a Power
Mac. If you're lucky enough to have a 8100, or any other model clock
chipped to 80 MHz, it's smooth at 640x480 in 16-bit color. How about the
Wing Commander III demo for the IBM? (800x600 was completely flawless on
my friend's 90 MHz Pentium. Very impressive graphics.)

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

OK here goes...

Imagine we as members of comp.sys.atari.st[.tech] are designing the new Atari range.

What would you want in it??? (No going "interstellar" in your ideas here - let's just see what we could come up with ok?)

First of all... _No_ 2 1/2" internal drive as these don't give as much room or speed as 3 1/2" ones.

A decent resolution - 1024X768 in _colour_ would be fine. And continuing to have screen memory _anywhere_ in memory and not just on a graphics board like those _other_ computers we Atarians love to hate =8-]

I think we should have _pull down_ menus as those "crash-down" ones are somewhat annoying (doesn't everyone agree???)

An '040 or '060 as '030s are just too old. And at least 50 Mhz ???
A DSP to do all the "extra-work", and of course decent sound - stereo, with good A-D/D-A converters with decent s/n ratios.

1.44 internal drive, and HDD as standard (say 540M or so?)

A _separate_ keyboard - with keys that don't feel like a sponge (like my 1040STfm)

The ability to have scroll registers so that hardware scrolling can be done without having to resort to time-consuming software implementations - remember the old 8-bit atari and how easy it was to scroll the screen???

Decent horizontal blank interrupts (like the 8 bit atari!!!) that let you swap palettes... (although a large palette to start with would be nice).

Multi-tasking doesn't seem to be too way out these days and it would be nice if we could get rid of the 8+3 filenaming convention - lets have longer filenames - and perhaps add a bit to remain compatible with previous disks...

Well that for a start seems ok - what do _you_ all think???

Maybe if we suggest a few decent (and not too wayout) ideas, someone might listen that can do something about it???

Who knows?

I love Atari, and really don't want to have to buy a PC - but without some1 prepared to make a _new_ atari, what's the point???

In hoping that this will start a thread...
Richard =8-]

PS. (For Roger Sheppard) This is just a bunch of ideas, so please don't go decrying a really nice idea ok?

You must have done something revolutionary to you lates updates. I just got
MGIF 4.2B after seeing your praises a lot, and with that I discovered:

It does not display any colours :-(
It can not change resolution and back to original :-(
I does not have a virtual screen (so mostly you seen only part of the pic,
if you don't do zooming (too many keystrokes for that!)

Times (the time from dropping a picture over the program to the moment
that picture is fully drawn to the screen):

(NAOMI.GIF 638*819 256 colours 409715 bytes)

MGIF 4.2B (true colour mode, displays
pics in interlaced
grey shades) 25 sec.
(256 colour mode, displ.
in grays) 55 sec.
TURBOGIF 1.3 (all resolutions, as it can
change to VGA/256 and back) 7 sec.
GEMVIEW 3.08 (256 colour mode, with all
shareware delays and module
loading plus optimizing
colour map) 43 sec.

Not to mention that the full code of TurboGIF is 2867 bytes!!

So, does MGIF 4.4 has colours, resolution swap, virtual screen,
speed etc.? Is it available on ftp?

Read the news, man! There are 2 new TOS-machines in the market now and
more coming, there are more software available for TOS-machines than
ever before (didn't you read the list of non-musical progs a few days
ago?).

Point is, Atari's policies or Jaguar's success has *nothing* to do
with the future of TOS-based computers: if the operating system
lives and is developed, the machine on your desk will get plenty of
exiting programs in the near future.

I constantly wonder how people (especially Englishmen who live next
to Germany) don't see what's going on in Germany, where TOS-based
computers are considered professional tools:
there is more activity than ever before, and the quality of both
hard- and software is extremely good. Also the prices are going down
(in Germany Calamus SL costs about 400 DM and Cubase Audio 1100 DM -
and those prices are not low because nobody's bying them :-))

Use the Fax and phone and you'll get all that stuff right into your
doorstep.

Stop whining, try to acquire a copy of a German magazine
"ST-Computer", and you'll see what really is going on in Atari-front.
Maybe some of the German fellows would give us an address to
subscribe it.

Sorry about getting a bit carried out, but I'm fed up with people
mailing these "an ST magazine went down, now I'll have to sell my
computer and kill my mouse" -messages!

4525. MGIF 4.4 Was: 040 Board for Falcon?

Newsgroup: comp.sys.atari.st
Date: 1994-12-04 12:12:14 UTC

I sure have... ;-)
(My history file is twice as long now for example.)

>MGIF 4.2B after seeing your praises a lot, and with that I discovered:
>It does not display any colours :-(

That was added to MGIF 4.3 about 15 months ago.

>It can not change resolution and back to original :-(

MGIF 4.4 never changes the resolution. If you run it from a 1008x608x8bit
or 480x480x16bit mode for example, your pictures will be displayed in that
mode.

>I does not have a virtual screen (so mostly you seen only part of the pic,
> if you don't do zooming (too many keystrokes for that!)

I've not added any kind of virtual screen support, since MGIF 4.4 works
quite nicely with for example the virtual screen support in BlowUP030.
Some people seem to want it, though, so I guess I'll add it in some form
eventually.

>Times (the time from dropping a picture over the program to the moment
>that picture is fully drawn to the screen):
>
> (NAOMI.GIF 638*819 256 colours 409715 bytes)
>
> MGIF 4.2B (true colour mode, displays
> pics in interlaced
> grey shades) 25 sec.
> (256 colour mode, displ.
> in grays) 55 sec.

But, as you say, this is version 4.2. ;-)

>Not to mention that the full code of TurboGIF is 2867 bytes!!

MGIF 4.4 is more like 220kbyte right now, but it can do a bit more...
I'm thinking of doing a 'lite' version, but with all the colour mode
support it would probably be over 30kbyte anyway.

>So, does MGIF 4.4 has colours, resolution swap, virtual screen,

MGIF 4.4 can display in any non-graphics card mode on a ST, TT or Falcon.
It's not primarily ment as a viewer and, thus, does not change the
resolution and does not implement its own virtual screen (so far).

>speed etc.? Is it available on ftp?

Speed of GIF loading beats everything else right now, but the JPEG, Targa,
PPM and PI? loading (and GIF, Targa and PPM saving) uses the code from the
IJG (the cjpeg djpeg people) library and is not that impressive.
Drawing speed is very good for some modes (like 256 colours), but not that
impressive for other (flickering monochrome). Everything is _much_ faster
than MGIF 4.2.

Regarding availability, I never seem to get around to doing a proper
release of this program. Version 4.4 has been in beta for more than a
year now, but I always find more interesting things to add or change etc.

Every time I mention MGIF here, I also say that anyone interested can
email me, but perhaps it's time to do something a bit more efficient:

- Anyone who wants to try out MGIF 4.4beta can fetch the 0927 version
from my ftp site, rand.thn.htu.se. All accesses are logged on this site.
There are of course newer versions than this, but a couple of rather
major changes to the GUI have been made since then, which are not yet
entirely operational.

- If you fetch the program, please let me know by email, so I can contact
you when new features are added.

- All questions, comments, suggestions, bug reports etc are very welcome.
MGIF, especially in its 0927 form is not a very simple program to
understand and use. The included documentation is not complete and
probably wrong on a couple of issues.
The comments.txt file answers some common questions.

***** MGIF 4.4beta should not be made available from any other *****
***** place besides my ftp site, since I want to have some control *****
***** over what is technically a beta release. *****

>PC to do most of the rest, but I cannot afford both. Something's got to
>go. Should I sell the ST & get a PC, or keep the ST and wait for a system
>that isn't crippled to come out ?

Well, even if you don't mind the PC interface (I'm assuming you mean
Windows), it's totally unsuitable for MIDI work, even with an excellent
sound card. Windows simply can't handle the split-second timing you
need for MIDI work. If the MIDI software you wanted to use had an OS/2
version (or a Linux version, or a NEXTSTEP version, or a...) it'd be
another story... a system with pre-emptive multitasking should have no
problems with MIDI, as would a system with no multitasking (ie, DOS).

>Surely we would *all* be better off attacking the manufacturers and
>demanding a new system that *works* clean and fast. All this in-fighting
>is only going to let them [the manufacturers] get away with it again.
>(so, you can tell I'm a union man...:-))

Manufacturers are VERY VERY reluctant to produce anything "new",
especially with crappy systems (ie, IDE disk, ISA bus, 15" SVGA monitor
that'll make you go blind if you use it at 1024x768 for more than a few
hours at a time, etc) selling as well as they are.

If there was a PCI-only system actually designed to take advantage of
the Pentium (ie, 64-bit databus to memory. SCSI on the motherboard with
DMA access, etc) it would be great. It'd probably also be expensive,
since it wouldn't be using things that were R&D'd years ago.

Nobody'd buy it though, because:

1) it doesn't come from Microsoft
2) it's not compatible with 8088 apps built in 1983

Backwards compatibility is crippling the computer industry in the 90's.

>ahh..no.. Most software, even shareware games, are using 32 bit extenders

Gee, that's odd... *All* of the DOS software I've got at work (and I've got tonnes) doesn't, except for DOOM. Even DOOM doesn't use protected-mode on a '386-or-higher... how do I know? I run all this stuff under OS/2.

I haven't seen a shareware game that uses a DOS-extender (and my cohorts bring in almost every game), and I haven't seen an application that uses one (although MS C 7 uses DPMI if run under OS/2 or Windoze or '386MAX) except for The Major BBS, which is evil.

I think you're confusing "some" with "most". If "most" software used 32-bit DOS extenders, you wouldn't be able to keep EMM386 (or QEMM or 386MAX or whatever memory-managing kludge you've got) in your CONFIG.SYS/AUTOEXEC.BAT, because they just don't get along (look at go32 in djgpp).

From: cherborth@semprini.waterloo-rdp.on.ca
Message-ID: <H.eg.2w&hvQASSp2@semprini.waterloo-rdp.on.ca>
Source record: 175357

I've been thinking about how, in Febuary of 1986, I bought a 1040ST (1M RAM, excellent graphics, etc), a colour monitor, and a 9-pin printer for about $2100 Cdn.

At the time, this was one of the fastest home computers available, with tonnes of RAM, an excellent interface, etc.

These days, you can't get a really good home computer for less than $5000 Cdn. :-(Last night, just for yucks, I was going through Toronto Computes! a PC-centric "newspaper" distributed around here by some of the computer stores. I went through it, looking for the best prices on components for what I consider to be a good PC (ie, probably too much for "normal" DOS users, but I want something better than DOS).

Anyway, these are the best prices I could find around here. For prices in US dollars, multiply by .77.

$ 710 -> 16M RAM SIMM (72-pin)
$ 449 -> ~500M SCSI disk (I think it was 520M or 540M), Quantum
$ 369 -> PCI video card, #9 GXE w/2M VRAM (VERY fast under X or NEXTSTEP)
$ 395 -> PCI SCSI-II card (Adaptec 2929 or whatever it is)
$1485 -> PCI/ISA (ick!) Pentium/90 w/256k cache motherboard
$ 49 -> hopefully, a decent keyboard (others were as cheap as $19)
$ 69 -> 3-button bus mouse + i/f card
$ 105 -> Logitec Soundman (ie, Soundblaster-16)
$ 249 -> SCSI CD-ROM (doublespin, internal)
$ 62 -> Mid-tower case w/230W power supply
$ 785 -> 17" monitor (crappy MAG monior, I think)
$ 29 -> 2 serial/1 parallel/1 game ISA I/O card
$ 43 -> 3.5" floppy (hopefully, it'll plug into the I/O card!)
$ 30 -> guessing... for internal cables and connectors

Total -> $4829 + 15% tax = $5553.35 (YIPES!)

+$0 for Linux, and you've got an excellent PC system, and no money goes to Mickeysoft. Still, pretty damned expensive. :-(

This is between 7% and 8% _higher_ than the Pentium/90 system that I
"put together" from components (so I wouldn't be saddled with
DOS/Windoze that I don't need/want) in the "Obsolete" Ataris thred.

Ouch. I knew Power Without the Price wasn't true for machines != ST,
but I didn't realise it was _that_ bad. :-(

You've missed the point. I think the Falcon is an excellent machine,
I have all I need a Comms programme, wordprocessor (Papyrus, which I got
last Monday) plus a few other useful compilers and progs. All in all I
like the machine and have NO intention of parting with it. That is not

the issue it is rather the level of support, which will now be so small
in the UK, I doubt we will even get programs translated into English soon,
they'll all be in German.

I spent (invested) a lot of Money (which I dont have much of) in the Falcon,
I new it was a fringe machine, but I didnt expect STR to go belly up
within six months of buying it.

Would it not be possible for Vic & Co, to set up a new magazine elsewhere?

Will you compile your replies and post them at an appropriate date? This
is an interesting subject.

>An '040 or '060 as '030s are just too old. And at least 50 Mhz ???
>A DSP to do all the "extra-work", and of course decent sound - stereo, with
>good A-D/D-A converters with decent s/n ratios.

Let's have QUALITY audio in/out ports WITHOUT bass boost. (If I wanted the
bass boosted, I'd adjust it on my amplifier, thank you very much.) How
about more than just left/right stereo? Maybe 4 or 8 or even 16 ins/outs
(optional, perhaps?) for those with a musical interest?

>1.44 internal drive, and HDD as standard (say 540M or so?)

TWO internal 1.44 drives, PLEASE!

>A _separate_ keyboard - with keys that don't feel like a sponge (like my

>the Michtron BBS was one of the least easy-to-use things I'd ever seen.

The CATscan BBS doesn't have an e-mail set-up. That doesn't mean it
doesn't exist - I have e-mail on my system and I run the same software.
Yes, you left a message in a public forum, but you had the option to
send it as a private message.

Sorry, but I can't agree with your comment that MichTron BBS is one of the
least easy-to-use things out there. There may be some MichTron boards
which have made their menus, etc. difficult to follow, but that's not
the fault of the software. In most cases, a simple tap of the Return key
or a "?" will give you a list of the available options. MBBS is very
user-friendly! If it weren't, I wouldn't have stuck with it for over
7 years!!

Could someone post a report of the recent Toad Fest? I would like to know the overall feeling of those in attendance. Was there excitement about new products in development or dissapointment due to lack of Atari support?

My interests are in Falcon products, and specifically in the DeskTopper case. When will Toad stock this item and at what cost?

Thanks,
Sam

True, there's only 2 input channels, but you could always get an ADAT for
multi-recording and dump the stuff to Cubase for editing.

Yes, recording via a DAT/SPDIF-interface gives pro results, but DAT's are
needed anyway for a pro setup, and they are much cheaper that separate
converters.

>I think one of the problems with the Falcon is that it is a hobbyist
>computer with professional aspirations. The codec isn't up to pro specs,

Who need OS anyway. For most of the people it's a program that launches
applications. Eg. Cubase Audio has it's own operatig system inside,
and it's a part of the reason it's so powerful inside a 16Mzh Machine.
In Mac's and PC's OS tries to govern everything, so programmers can't
get too creative.

>It comes with a ridiculously small hard drive in an
>inconvenient form factor, so that it's more expensive to add storage than

I bought my Falcon with no internal drive at all, and SCSI cases with power
supplys are quite cheap nowadays. No adapters are needed for external

SCSI connection, just plug and pray.

>The basic problem is that Atari had to design it for the hobbyist market,

>entire music industry, as has been evidenced by the ever-slipping market
>share of Atari in the music world.

Define "professional" and "hobbyist"? These days with this new
technology the terms are getting vague.

The music industry uses a bit more expensive systems anyway ('cos
they have all the money they need), Falcon is a good solution for
all composing musicians and bands, who want to do Master-tapes in
their homes. I'm a professional musician, and I require the best
audio quality (Falcon with a DAT/SPDIF gives enough quality for me),
and I know that Falcon is utilized in many studios here in Finland.

Falcon's price/quality factor when selecting a home studio 2D2/Midi-
system is excellent, and you can do 95% of what you can do with a
Digidesign system, and in some areas more (sequencer, notation,
sampler mode, realtime effects etc.).

What is missing in Falcon are balanced connectors
and more outputs, but if you get an S/PDIF interface and 8-channel
D/A expander (they are together 1000.- DM) you have a very pro
system with 1/3rd of the price of a Digidesign system.
You can also get a rack-case with better connectors for stage work.

There are many musicians here in Finland who has got this setup
instead of a Mac- or PC-based setup, and there are no Atari-dealers
or magazines at all in this country.

Yep, if you actually tried to do anything realtime with the Atari OS you'd be toast. The point is, the more services the OS gives you, the less likely it is (as a programmer) that you'll have to implement them on your own. Also, wouldn't it be neat to do things like have several programs access the MIDI ports?

> In Mac's and PC's OS tries to govern everything, so programmers can't
> get too creative.

This is definitely not a true statement! The #1 OS on the PC, DOS, is barely there at all. It governs almost nothing. It provides some *very* basic I/O services and not much else. As for the Mac, if you want to go out and write directly to screen memory and to the sound chip, nobody's going to stop you. Many Mac games work that way. (Many of them fail to produce sound on my computer, because they try to write directly to the registers of the Apple Sound Chip, which is nonexistent on Macs with 16-bit sound. If they had called the Sound Manager to produce sound instead, no worries. See how it is often nice to have an OS layer?)

> I bought my Falcon with no internal drive at all, and SCSI cases with power
> supplys are quite cheap nowadays. No adapters are needed for external
> SCSI connection, just plug and pray.

I must be slipping - I forgot the Falcon has built-in SCSI! :-)

However, as I recall, if you buy the beast with no HD, you also get it with 1 MB RAM, so you have to pay more for expanding RAM... (I hate that silly daughtercard design they used. It would have been just as easy to slap a 72-pin SIMM socket right on the motherboard. 72-pin SIMMs currently are available in sizes of 1, 2, 4, 8, 16, and 32 MB.)

> Define "professional" and "hobbyist"? These days with this new
> technology the terms are getting vague.

Professional: Somebody who's making money off of it.
Hobbyist: Somebody who's playing with it.

There, that was simple, wasn't it? Oh, the hobbyist also typically can't afford to spend anywhere near as much on the machine.

> There are many musicians here in Finland who has got this setup
> instead of a Mac- or PC-based setup, and there are no Atari-dealers

any suggestions?????

4551. BBS Packages for the ST?

Newsgroup: comp.sys.atari.st
Date: 1994-12-04 20:16:06 UTC
From: scroggkw@Rose-Hulman.Edu
Message-ID: <scroggkw.14.786572166@Rose-Hulman.Edu>
Source record: 175362

What BBS packages are being supported still for the Atari ST line? Is Ratsoft ST still being written and supported? Are there any new programs that support Multi-Line (Not Michtron or Nite-Lite) on Mega STEs? Where might I find some info, ie support BBS's, maybe a FAQ on the subject? BTW, I use to run a FoReM BBS, then a TurboBoard ST BBS, then Ratsoft ST, and finally switched to PCBoard when my old Atari STE couldn't handle a 28.8k modem, 1.5 Gig HD, and a CD-ROM. I really miss Ratsoft ST, but my BBS is now 3 nodes....

>: A: The warning label.

> "Intel inside, idiot outside."

Here you go:

Q&A: THE PENTIUM FDIV BUG

Q: How many Pentium designers does it take to screw in a light bulb?
A: 1.99904274017, but that's close enough for non-technical people.

Q: What do you get when you cross a Pentium PC with a research grant?
A: A mad scientist.

Q: What's another name for the "Intel Inside" sticker they put on Pentiums?
A: Warning label.

Q: What do you call a series of FDIV instructions on a Pentium?
A: Successive approximations.

Q: Complete the following word analogy: Add is to Subtract as Multiply is to

1) Divide
2) ROUND
3) RANDOM
4) On a Pentium, all of the above
A: Number 4.

Q: What algorithm did Intel use in the Pentium's floating point divider?
A: "Life is like a box of chocolates." (Source: F. Gump of Intel)

Q: Why didn't Intel call the Pentium the 586?
A: Because they added 486 and 100 on the first Pentium and got
585.999983605.

Q: According to Intel, the Pentium conforms to the IEEE standards
754 and 854 for floating point arithmetic. If you fly in aircraft
designed using a Pentium, what is the correct pronunciation of
"IEEE"?
A: Aaaaaaaiiiiiiiiieeeeeeeeeeee!

>those _other_ computers we Atarians love to hate =8-]
Well, this can be a problem. Its REALLY hard to get very high resolution
video from a screen memory common to the computer's main RAM. It makes
the use of dual-ported VRAM impossible, which results in MUCH higher bus
loading for video traffic, limiting the available bandwidth for the
main CPU.

It certainly is CONVIENENT to the programmer to be able to allocate
screen memory anywhere in RAM, but will severely limit the possible
standard video resolutions or the CPU's throughput in higher resolution
modes.

>
>An '040 or '060 as '030s are just too old. And at least 50 Mhz ???
A PowerPC processor.

>

>1040STfm)
Yes, this is the MAJOR reason I never bought a Falcon.

>
>The ability to have scroll registers so that hardware scrolling can be done
>without having to resort to time-consuming software implementations -
>remember the old 8-bit atari and how easy it was to scroll the screen???
Well, it was also trivial to scroll bands of the screen... in completely
DIFFERENT directions. But this seriously complicates using a "standard"
bit mapped graphics system like the AES/VDI that just does not include
the concept of discontigious displays and scrolling outside of windows.
A good hardware Blitter in the video/graphics system that could handle
not only quick scrolling (by moving data) in windows and over the whole
screen, as well as general graphics data movement/operations would be

much more useful (in my opinion) than just hardware scrolling registers.

>
>Multi-tasking doesn't seem to be too way out these days and it would be nice

Multitasking and filenames are completely unrelated issues.

I've done multitasking on 8080 and Z80 based embedded systems that
didn't even HAVE a filesystem of any kind, but ran only preloaded
ROM based software.

>
>I love Atari, and really don't want to have to buy a PC - but without some1
>prepared to make a _new_ atari, what's the point???

Well... I'll probably be switching anyway to something PowerPC based.
Although I'd really like to see someone OTHER than Apple selling
them, before I have to commit my money.

Can anyone please tell me how to add a message to the file selector
(e.g. "Select file to LOAD"), from TOS 1.02? I am using UIS 3, and have
several proggies that use it, but have no idea how it is done.

If it's any help - I program in C, assembler, GFA Basic - so I should be
able to configure any answer I get to suit one (or more) of the above.

Thanx,
Richard =8-]

Not true. Insignia are fine about releasing it. The problem is that Atari
own the rights and until they say OK, Insignias hands are tied. I would
say Insignia have been more than helpful so far and I have talked on many
occassions with them regarding this matter.

Atari on the other hand are untouchable. Emails are ignored, phone calls
(not cheap from UK to US) are not taken.

> And to be totally honest, using a DOS/Windows software-based emulator

SoftPC has a Norton of 0.8 or so on a Falcon and 1.3ish on a TT. If you
try and run WIndows on it you probably need your head tested. it's OK if
you *really* need to run some simple DOS stuff or have a lot of time.

I have never encountered a need for a Global Midi Manager (Apple's Midi
Manager is actually so "bad", that eg. Cubase programmers recommend not
to use if you don't really have to (in multitasking).
OMS is much better, so is MROS, but those are not part of the System 7 or
Windoze.

I got mine without memory at all. I added 4 4Mb SIMMs to the Falcon Wings
card (the price of the card was 1/10th of the price of the SIMMs).

No problemo.

>Hobbyist: Somebody who's playing with it.
>There, that was simple, wasn't it? Oh, the hobbyist also typically can't
>afford to spend anywhere near as much on the machine.

What about semi-professionals, or a musician, who uses the equipment
in his freetime for self-developing and not for money-making?
Eg. I have a dayjob in the orchestra, and I do not make money with
my Studio (yet), as only thing I do is composing and some arranging.
Yet I have spent about 20-25000 dollars into my equipment (89-94).
Things are not always so simple (= pro's use money, hobbyists do not -
might be vice versa in many cases).

I made money with my Mega ST, so does it make it also a professional
machine? I'd like to add that the price of the tools have almost nothing
to do with the amount of the money that's made with them, if you are
otherwise competent musician (or producer - whatever).
Hit records have been made with a 4-tracker.

I'm getting an STe shortly, and want to use it for sequencing. I've pretty much decided on C-Lab's Creator. I have some questions, and was wondering if anyone could help:

1) What is the latest version?

2) Will it run %100 with only 1 meg of ram?

3) Any problems running on an STe?

4) Anything else I should know?

Please reply by e-mail only. Thanks!

For the Falcon, it works, but since you are describing a desktop model,
of course a 3.5" SCSIII drive would be mandatory. :)

>A decent resolution - 1024X768 in _colour_ would be fine. And continuing to
>have screen memory _anywhere_ in memory and not just on a graphics board like

Would require more and more main memory the higher the rez you go. I wouldn't
mind some sort of compromise.

>I think we should have _pull down_ menus as those "crash-down" ones are
>somewhat annoying (doesn't everyone agree???)

No. I prefer drop-downs over pop-down (Windows) and especially over those
finger-ruining mac strain-down :) menus.

My falcon doesn't feel like a sponge. $10 for the TT touch and about an hour's
work and it's great!

>The ability to have scroll registers so that hardware scrolling can be done
>without having to resort to time-consuming software implementations -

This is really only needed for games or ugly-Amiga-like "screens" junk. :)

>Decent horizontal blank interrupts (like the 8 bit atari!!!) that let you
>swap palettes... (although a large palette to start with would be nice).

With a true-color mode, you don't need this. this would only be a hack
useful for games and full-screen slideshow programs. I'd prefer software
to become more standard, running in a window, etc. If you want this hack,
get an Amiga and play with HAM. :)

>Multi-tasking doesn't seem to be too way out these days and it would be nice

MultiTOS works. 8 + 3 I have never had a complaint about, but if we switch,
make it UNIX-compatable. jsut say NO to mac filenames with spaces et all.

>Well that for a start seems ok - what do _you_ all think???

it's a pipe dream, and basically what most people want. :)

>Is there any programm available at an ftp site for undeleting files ?

I'm sure atari.archive.umich.edu has dozens of them. The way I would do it is to take a sector editor to the disk, find the appropriate directory entry (if the files were in the root directory it will probably be in sector 11), and replace the $E5 character at the start of the filename with the original first letter. Disco!

Then you'd probably be best copying all the files to a new disk altogether. I'm not sure exactly what happens when you delete a file (presumably more than just the $E5 thing) - none of my books goes into any detail. (Anybody know for sure?)

It's safer to do it this way than trust a real "undelete" function which might recover the file to another part of the disk and inadvertently overwrite any other deleted files you might wish to recover.

Note that this method will probably fail (recovered files contain garbage) if you've saved anything on the disk since deleting your files, but an "undelete" would fail also.

I believe DLII024 (in an archive called DLSUITE or somesuch) and ST_TOOLS contain sector editors, but I don't know if they work on the TT. There's a directory on atari.archive called Diskutils which is full of disk utilities.

I really need a nice word processor for my 1040st (2.5 meg) to use for writing papers at school. I am considering getting a pc because there is so much selection for word processors (and I already know how to use word perfect and microsoft word)... I use Word Writer ST right now but I really don't like the fact that it has so many bugs in it. I hate how the formatting works and I just need a nicer program.

What is available for the st that has all of the main features (especially easy use, no bugs, spell check, search/replace, multiple fonts) and will work with a panasonic (epson) printer.

I would really appreciate any help. I wish I could just download a new word processor and start using it. I am really sick of using Word Writer ST, and I really don't like Word Perfect 4.1. What a waste of time!

Thanks in advance.

Don't feel too depressed. I spent over 1000ukp 5 months ago. Okay so I've bought a PC since then - but I don't regret spending the money on Atari kit.

> NO intentions of persuing Personal computers. Also it seems the JAG
> has bombed sales wise so perhaps we wont even have Atari in existence
> in a year or so.

Well it would be nice if you could buy one. I went to Tottenam Court Road in London, Saturday (for those non UK readers TCR is the UK 'mecca' of consumer electronics). I spotted *one* Jag! That was a display model as well. There were probably a few that I missed, but there was no shortage of software (and hardware) for all the other consoles.

The Jag is good, but Atari have to *sell* them. The've been very bad at this bit in the last few years IMO.

Now hang on here - its not SoftWindows we're talking about but SoftPC.
SoftWindows has not been ported to the Atari AFAIK, and the SoftPC that
does exist does *not* allow you to run windows. Not unless you can get it
to run in CGA mode *without* a mouse that is.

:-(

Roland.

I saw 2.5" 540Mb drives in a shop on Saturday. Bet they were dead fast as well. Small drives are just not cost effective anymore.

Another good reason for buying a large IDE drive (on a PC) is the general limit of 2 per 'interface'.

SCSI is much better in this respect.

Roland.

I think I got mine for $10-15 from Oregon Research - can also
be purchased from Motorola DSP56000UM/AD Rev 2. Didn't find
ISBN but did find:
USA Motorola Literature Dist; POB 20912; Phoenix AZ 85036
Europe: Motorola Ltd; European Literature Center; 88 Tanners Drive,
Blakelands, Milton Keynes, MK14 5BP, England

Happy Hunting. PS- there is also a Real Time Digital Signal Processing
Applications with Motorola's DSP56000 Family by Mohamed El-Sharkawy, PHD
-its Prentice Hall ISBN 0-13-767138-5 - and if I remember correctly -
its about $55.

I can get these to work seperately (sp?) but they crash when I try to use Mint with the Minix.xfs file in place (i.e. bombs or automatic reboot).

I'm using Minix .055 (the one with the Mint distribution Kit. Also, I couldn't get the long filenames to work.

I would like to run MintNet in conjunction w/ Ka9q to Net a 520 to 1040 and the 1040 to a PC.

(I.e. MintNet on the 520 (has a HD,) Ka9q on the 1040 and the PC, (1040 does NOT have a HD, pc does) Have TOS 1.0 on the 1040, and TOS 1.4 on the 520. 520 has 2.5 Megs RAM.

P.S.: What kind of memory chips do I need for an easieST Unaeroco Ram Board, I have 16 open slots, 2.5Megs of RAM with what appears to be 18pin Dips (9pins on each side)

(Please E-mail Responses to harmony@tyrell.net)

>the wimpy HD Atari puts in the Falcon.

True! And so is 500Meg if yo don't have something to store it on.. like A
DAT player or something... ofcourse all digital!

>16-track recording isn't possible with the base Falcon hardware, either.
>There is only one stereo codec in the Falcon.

I heard that they are fusing 13-bits when you have 16tracks in
CubaseAudio, still you can have LOTS of MidiChannels at the same time!!

>As far as I know, the Falcon has this problem too - that the built-in
>codec is not very good at all. For both machines, it appears that pro

You don't know much about the falcon, do you?

Falcon has SCSI-II! NO ASCI! So you can plug the same (external) HD that
you use for your Mac to the falcon just by using a SCSI-II to SCSI cable!

Clifton S. Mothershed (cmothers@netcom.com) wrote:
: Is there a Zmodem Accessory, I heard GRZSZ43 is one but it is cripple ware.

Well, that is true, but let me just say GSZRZ is an excellent Zmodem program, and is constantly updated. The latest version is 5.4 (November 29, 1994). For such a well supported program, I think it is still well worth the 35 DM price.

I know there are those who prefer to go with other Zmodem programs like XYZ or others, but I have to applaud Michael Ziegler for his support and upgrades of this program.

GSZRZ and Connect are great together, but Connect is harder to use in less than 640x400. The great thing about GSZRZ is that you can use it with any comm program that supports external protocols. I don't think it works as an accessory unless it is specifically supported by the program, like Connect. And I don't believe it works with ANSITerm because that was written to work with XYZ specifically, but I could be wrong.

Personally I use I combination of Uniterm and FZDT with GSZRZ on my ST. If I had a mono monitor or a TT or Falcon, I'd probably use Connect. But that's just my opinion.

Michael Olin (molin@cxc1.cl.msu.edu) wrote:

: TWO internal 1.44 drives, PLEASE!

A better idea would be 2.88MB drives. Although I haven't used any
2.88MB disks, these drives are noticeably faster even with 1.44MB and 720KB
disks.

: And a REAL mouse, not this cheesy (pun intended) POS that Atari makes.

It's not so much the mouse that annoys me, but rather where you
plug the mouse in on the ST keyboard models (520ST, 1040ST, etc). You lift
up the keyboard and then spend forever trying to plug that thing in! I
now use a Mega STe and find it much nicer to work with.

As for the hardware innards themselves:

1) If I were going the RISC route, I'd choose a chip made by either
MIPS (Say an R8000), or a PowerPC. My only reservation about this is that
you would need a large hard drive (preferably SCSI) to keep all the
binaries. I tend to equate RISC with fatter binaries!

2) 24-bit graphics would be plus.

3) DSP!!! Improvements anyone?

As for software and GUI, I recommend taking a look at NeXTstep. From what
I've seen it looks impressive! Better still, I hear NeXT is working on a
GUI called OpenStep which is supposed to be pretty revolutionary. Atari
should take a look into that (if they were willing to put the time and
resources into a project of this magnitude).

: Also, lets finally SEE (and not just hear about) a notebook version.

That'd be impressive!

>version (or a Linux version, or a NEXTSTEP version, or a...) it'd be
>another story...

i run cakewalk pro (now 2.1; just got 3.0 upgrade) for windows (3.1) on
a 486/DX2-66 with no problems whatsoever. i am using the music quest
MQX-32M midi interface (which gives you 2 ports, each with 16 midi
channels, for a total of 32 midi channels). the MQX-32M and cakewalk
allow me to sync (with MTC or SMPTE - i use SMPTE) the sequencer to a
multitrack (in my case a tascam DA-88) in real time. i have never
experienced any glitches, dropouts, etc. i have run up to about 30
tracks so far (cakewalk supports up to 256 tracks). and i have quantized
to 1/48 beat at 120 beats per minute. no problems.

IMHO, cakewalk pro is one of the most solid, well written pieces of s/w
i have ever used (on any platform, in any discipline). cakewalk (according
to their last newsletter, and a survey printed in oct94 issue of Music and
Sound Retailer) is now the best selling music s/w in the US.

many records today are produced with cakewalk on a PC. most pro studios
either run macs or PCs. i would think that most home studios in the $20k
range are run with macs and PCs as well. i read Mix, EQ, EM, keyboard,
Recording, and other magazines on a regular basis and there is very little
mention of any computers other than macs and PCs. 5 years ago atari was
king. things are different now, however. the pro audio store where i
shop has a PC. no atari in sight...

> (Actually, it runs just about the speed of a 32 Mhz TT).

Now, wait a minute! I thought the Gemulator for PC's is a hardware card,
so I guess the Gemulator on your Pentium runs about the speed of a 32 MHz
68030 because there _is_ a 32 MHz 68030 on the card!!
So, even a 286 with this card would perform like a 68030 with 32 MHz.

And then, I really doubt, that "even" a Pentium with 90 MHz could
ever come close to software-emulating a processor like the 68030
with a speed of 32 MHz, the more, as the Pentium has less registers on
chip than the 68030 (if your figure of 8 on the Pentium is right (the
68030 has 16 if you don't count SP's and SR's). So the Pentium would have
to store some of the registers of the emulated 68030 in RAM - you can
figure how slow that is, even with cache memory, compared to internal
register operations.

The PowerMac can emulate an 68030 at reasonable speeds
because the PowerPC-CPU has the 68030 instruction code on chip.

> Your final comment has me most interested. You obviously know more
> about Microsoft than I do, and I work here!

Well, obviously one doesn't need to know much about assembler-code and
processor hardware to work there. Not much surprising, when you look at
the speeds of some of their programs.

Volker

Yeah!!! What he said!! <:-)

No, really, is there any low-end (i.e. non-APEX media) stuff for the Falcon?
Especially wanted by me is a open-ended hypercard thing which would allow
the integration of Falcon-level graphics and sound. This could be simply
acccomplished by allowing the running of external prgs like MPEGPLAY or
whatever.

I can't believe nobody's corrected this yet. The authors of DOOM did not
roll their own replacement for DOS. They used a DOS extender - a
commercially available shell that handles all the dirty work of shoving
DOS into the background so that programs can run in 32-bit protected
mode. There are many DOS extenders available; the primary one Doom uses
is Rational System's 4GW (or something like that - I'm not sure of the
exact name). There are alternate versions of Doom available from id
Software which use different DOS extenders, because some systems have
problems with the normal one.

The new Enhanced-IDE standard bumps this up... I'm not sure how many,
though. (At least to 4.) And it adds support for CD-ROMs, and higher
transfer rates.

At US memory prices, that's $50 extra for the card. I'd rather spend that money on something else.

Atari got memory expansion right in the STe, but they screwed it up royally in the Falcon.

> might be vice versa in many cases).

I think we're getting into a definition problem. I meant "hobbyist" as a general term - not music specifically. That is, an individual who buys a computer for recreational purposes. Most of these people do not need the elaborate digital audio setup or MIDI ports on the Falcon.

> I made money with my Mega ST, so does it make it also a professional

Of course. That doesn't change the fact that, given a choice, most artists would rather use the best equipment possible, because if they are truly artists, they want their work to be perfect. :-) They may not have a choice about it, though.

Yep. In some ways, the Quadra 630 series is a replacement, though I don't
like some of the design compromises they made on that machine. (For
example, the video modes are quite limited compared to the 660AV.)

> I heard that they are fusing 13-bits when you have 16tracks in

Digital sound mixing is a problem - you have to be careful about your
algorithms to avoid losing big-time in the SNR department.

> Not too expensive for a Falcon as we have the DSP port out on the back...
> Just to plug external AD/DA-converters or more DSP-processors :^D

There's something like that on the Mac, too - the GeoPort serial ports are
capable of about 1 Mbit/s (which is what the Falcon's DSP port is also
capable of), and are used for connecting the DSP and/or CPU to external
sources of digital wave data. For instance, I'm using it right now - the
modem I use to make a PPP connection to the university computers is
actually a software DSP modem. A phone line interface pod sends digitized
phone line signal to the DSP through the GeoPort serial port, and the DSP
sends back a digital signal for the interface pod's D/A converter. On
PowerMacs, the main CPU performs the tasks that are done by the DSP on a
660AV or 840AV. (CPU load is about 15-30%, depending on the model. The
PowerPC features some DSP-like features, and bloody fast floating point.)

> So, even a 286 with this card would perform like a 68030 with 32 MHz.

As I'm sure Darek will tell you, the card contains ROMs. No 680x0
processor. The card is only there to get around the legal issues with
putting TOS ROM code on disk as a part of the emulator. In fact, as I
recall, you have to buy the ROMs seperately.

> The PowerMac can emulate an 68030 at reasonable speeds
> because the PowerPC-CPU has the 68030 instruction code on chip.

No! It doesn't. I don't know where people get this misconception from.
The PowerPC runs PowerPC code - that's it. What enables Power Macs to run
680x0 software is a damn fine software emulator. (Sorry, Darek, but I'm
more impressed with it than yours - it does some really astounding things,
like letting the Mac OS be mixed 680x0 and PowerPC code. And the
compatability is simply excellent - often software that failed on Quadras,
Microsoft Word 4.0 for example <G>, runs on Power Macs.)

If the PowerPC implemented 680x0 instructions, you can bet that a 80 MHz
PowerMac would be faster in *every* respect than a Quadra, rather than
only approaching the speed of a low-end Quadra in emulation. (Of course,
it waxes the Quadra if it has a native program to run...)

Interestingly, something like 80 or 85% of the current Mac OS release
(System 7.5) is still 680x0 code. Apple only converted the really
time-critical portions, those that are hit on the most, like QuickDraw.
The first System release that will be mostly native code is supposed to be
Copeland (System 8).

Since you do produce some shareware, where could I get a list of items
that you have produced for the shareware market, I would like to see a
list and maybe _buy_ some of your programmes if they do what i want.
With the limited supply of stuff coming in down here, I appreciate
anyone who takes the time to write and distribute Atari software.

What I'd like is a way to upgrade, Like a more modular system, and
real video out for animation or titling to videotape.
I'd like to see built-in emulation for macs and PC's. Hey, we're dreamin.
Also, the ability to run World Wide Web in full color, stock.
I need something (and maybe it already exists, I just have an STe)
that could run a graphics pad and paint simulating oil or watercolor,
real time.

Real time video?

Everything I've read can already be done on some other systems. Come on,
folks, let's dream a little. What about virtual reality, the real stuff
where you would be able to fly through the Smithsonian in truecolor, or
climb the Himalayas on your stairwalker? Interactive CDs and VR.

What we really need are as many programmers as do PC software, but as
clever and dedicated as Atari programmers.

4593. ST Upgrades: T28/Blitter

Newsgroup: comp.sys.atari.st
Date: 1994-12-05 08:11:13 UTC

Message-ID: <3buhv1$h7v@olivea.ATC.Olivetti.Com>
Source record: 175302

Hi there,
In some articles someone put a blitter in a stfm.
I thought it was not possible.. but if so is it worthwhile ?
Are there any company selling blitter chip ? ANd what the price ?
What a speedy setup: STFM +blitter+NVDI+Magic....

Another Topic: Anyone had experience with the T28/36 accellerator board
on a plain stfm? Any "soldering/trouble horror stories" ? It seems that
(at least from Magazines reviews) the installation is straightforward
and compatibility is good too. I really appreciate is someaone could
tell me how the T28 works with Cubase (rel, 2.01).

In article <1994Nov24.134511.25439@unix.brighton.ac.uk>, st39@unix.brighton.ac.uk (Stephen Ticehurst) says:
>TeraDesk seems to tell everything that you're in a command line, so STZIP
>displays a load of text instead of nice graphics.

All you need to do is to use the 'Install Application'
in Teradesk.
Look for the little box entitled 'Use ARGV parameters'
(or very similar). You will find that this is activated.
Click on the box to de-activate this option. STZip will
then operate normally.

These instructions are abbreviated - I asume that you
are conversant with 'Instal Application' etc. If you require
fuller instruction then feel free to e-mail me :

4597. Hard Drive Software suitable for Gasteiner HD

Newsgroup: comp.sys.atari.st
Date: 1994-12-05 09:41:05 UTC
From: ps1908@wlv.ac.uk
Message-ID: <3bun7h$4p@ccuf.wlv.ac.uk>
Source record: 175252

Hi, all.

I have recently received a Gasteiner 270Mb Hard Disk
complete with the Top Link controller.for my Atari STM
(TOS 1.4, 4M RAM).

However, between ordering it and receiving it , I saw a small
mag. review which basically stated 'excellent drive, shame
about the software - worst of the bunch'.

I have a copy of Atari's AHDI v5 which I tried to use to set up
the drive but it refuses to format the disk. (The Gasteiner software
formatted/partitioned the disk OK).

What I would like to know is:
(a) what other HD utility software is compatible? (ICD?)
(b) where can I obtain it?
(c) how much?
(d) what are its advantages over the Gasteiner set?
(e) should I get another controller (ICD?)

Any info gratefully received...

Steve (ps1908@scitsc.wlv.ac.uk)

: Yes. I think I well may boycott Future Publishing (not just STF) and switch to ST Applications
: which I haven't bothered with upto now.

Trouble is that STA has gone down to half it's size....and unless this increases, it will not be enough reading material to get you through the month. I heavily relied on AEO, CAIN, STReport, and the Three ST Glossies in the UK, and STA to get me through...I will have to rely more on club mags, and disk mags now.

STA cut down in size because it felt it was repeating what STR was printing. Now that STR has gone, I hope STA increases in size.

Having now used Papyrus for about two weeks I can safely say its worth EVERY penny. While it may not offer all the functionality of certain PC apps, it does offer LOADS of features and a very nice output. I can even get an excellent printout off my humble Star LC10.

Now just for a change why don't people BUY something rather than PIRATE it. This especially applies to students (like myself) now if you order it from Hi-Soft, you'll get 30% students discount. Now you cant say fairer than that!

>to run in CGA mode *without* a mouse that is.

Why no mouse? I've not tried running windows, but the mouse works fine with QuickBasic. You just need to load mouse.com first.

What res is CGA? SoftPC runs ok in 640*480*256 mode, faster in 640*480*16.

Anyway, with X for Linux68K on the atari in the next couple of monthes, who really cares about SoftPC anyway. There is loads of excellent softs for linux just waiting for a stable release version....

Craig.

4610. Re: MagiC-ROM

Newsgroup: comp.sys.atari.st

Message-ID: <3bus89$r6o@whitbeck.ncl.ac.uk>
Source record: 175314

Usual quesion:

How long are we waiting for the release of MagiC3 on the falcon?
I suspect that development has been slowed (frozen?) by the higher
profile MacMagiC....pure conjecture, but I'd like someone to
prove me wrong by posting an official release date.

System Solutions have been saying 'later this year' since before the
summer, but we're fast running out of this year.......

Craig.

4611. Re: Mega STE Shifter problems

Newsgroup: comp.sys.atari.st
Date: 1994-12-05 11:36:46 UTC
From: lais@cs.man.ac.uk
Message-ID: <3buu0e$2aq@m1.cs.man.ac.uk>
Source record: 175315

Hello !
So it wasn't just me ! What a relief - my MegaSTE also has crackly DMA sound and wobbly graphics on anything that messes with the video hardware (e.g. Photochrome, Spectrum 512 and even
the colourmap on Neochrome) but I have found that running the machine at 16MHz + cache alleviates
the sound problem. Also, super-palette graphic modes stabilize after some time. It appears that the chips need `warming up'.

However, I have many good STE sound/gfx demos which don't run at 16MHz + cache...
Anyone know where to get these replacement C300588-001 shifters ? The crackling in the sound
is annoying, and embarrassing when Amiga owners are around.

All help appreciated, cheers

S.Lai

Calligrapher Gold III is a good word processor (technically a document
processor) with multiple fonts, although not Speedo ones, spell checker,
thesaurus, label printer, .IMG graphics support, formula editor, etc. Some
people like Papyrus, but I have been using Calligrapher for four years now
and I haven't seen anything to beat it. It will comfortably handle large
documents by joining chapters. One of my documents is about 190 pages. There
are a few bugs, but nothing major. The only down side is that Working Title
are not supporting it anymore.

From: uel035r2a@tferi4
Message-ID: <1994Dec5.130723@tferi4>
Source record: 175337

I have two STs: 520 and Mega2. I would like to connect these machines somehow, so that 520ST would run like a terminal and Mega 2 would do all the job for both.

1. Is it possible to do it under MiNT?
If yes, how? RS232, MIDI, ...?

2. Can I run more GEM applications at once under MiNT? I have downloaded kernel and TOSwin and I can run only TOS programs.

3. If yes(2), can I run GEM application on "terminal" (=520ST), ie will I get the results on "terminal" screen?

Any tips would be appreciated.
Thank you in advance

Matej.Kenda@uni-mb.si

>Does Elite II run on the Falcon. Also does it have inproved graphics?

It sure runs fine on mine.
The graphics looks the same as on an ST but the frame rate is much better.
I tried it once an a friends STE and it was almost unplayable, but on a
Falcon it's normally smooth enough.

Tips:
If you want to enjoy the game, don't use the 'worm hole' routes that seem
to be popular. They are not a feature, but simply a result of overflow in
the distance calculations (16 bit).

4621. Future Publishing can kill Atari

Newsgroup: comp.sys.atari.st
Date: 1994-12-05 13:11:46 UTC
From: cm3hirjd@bs47c.staffs.ac.uk
Message-ID: <3bv3ii$da5@bs33n.staffs.ac.uk>
Source record: 175336

The subject may sound a little extreme.
But believe me its very true.

The superb magazine - ST Review - was recently sold off and purchased by Future Publishing. From what I hear Vic Lennard tried to put in a bid for Review but it failed.

So, will FP keep on two Atari magazines? I don't think so. This has a few bad effects

(1) There is now only one Atari magazine, ST Format. This means whatever they say goes - there will be no other publication to give alternative views or opinions. This is a bad thing indeed. They have never been that good on their coverage of the PD scene, while Review were incredible in that department. Will Format carry on Ofir Gal's excellent HiSoft Basic tutorials? I doubt it - maybe Ofit would like to comment here, I would be pleased if he does.

(2) Advertising. Everyone knows that Format charge a hell of a lot more than Review did. Will Format lower their prices? Like hell. They could put them up and no-one could do a thing about it because its the only place to advertise now. The smaller PD libraries and start-up companies who could afford the Review prices are now buggered unless Format do something very kind and miraculous in their Advertising department.

(3) There will be less coverage of Atari in the main stream press, with the removal of Review from the shelves this leaves only one magazine which lowers Atari's already low prestige.

Perhaps it was business sense on behalf of Future Publishing, I mean why not purchase your only main rival and close it down - means a sheer monopoly for you. Perfect business strategy if you ask me. But they couldn't give a shit about the impact this will have on the Atari community. Review were always devoted to Atari, their quality of journalism and articles reflected this well, sure they never had the DTP and layout jazz that Future Publishing magazines have, but that is all cosmetic when it comes down to it.

Future Publishing, although their intentions are not known at present, have probably in one swipe managed to kill off the Atari community as we know it. Does this sound extreme? Do I sound out-raged? Good. Because I am.

Feedback very very welcome from any parties concerned, I know you are on the net Format, so please, lets hear your comments. Tell me this is all a bad dream or something.

Until about last November I had a subscription to P6/NAU, the only thing
I noticed was that is was mainly waited in favour of the 8-bit (which is
what I owned at the time), from what I read of the ST stuff it was always
rather skimpy and certainly not as good as STR. Having said that the 8-bit
pages were VERY well written.

Is there any special advantage in using external Z-modem with Connect?
I've found that the internal Z-modem in Connect 2.46 (fixed) works just
fine, and with Selectric 1.10 you can do multiple sends with it.
It works also in background inside Connect.

Buy a PowerBook with MagiCMAC installed and you got all the notbooks you'll
ever need. And you get a decent MAC at no extra cost ;-)

Well, if there are no magazines, there will shortly be no commercial
software. Where do companies advertise and gain business?

I cannot forsee typical readers of STF (essentially games players)
being interested in, or purchasing, high end software like Papyrus,
Lattice C and DA Picture to name but a few.

The newer Macs are looking more and more attractive as time goes by...

>documents by joining chapters. One of my documents is about 190 pages. There
>are a few bugs, but nothing major. The only down side is that Working Title
>are not supporting it anymore.

Calligrapher has :
+ Thesaurus.
+ Formula editor,
+ PS output (poor but does work),
+ Structure editor (Thought! style hierarchy mode)
+ Styles can be applied to units of less than a paragraph.
- Visible rulers (yeuck!)
- Few typefaces, ALL fonts in an expensive proprietary format.
- No GDOS fonts support
- Multi-chapter support.

Papyrus has:
+ Non-modal dialogues
+ Zoom modes
+ Frames
+ Master pages
+ Text/graphic runaround
+ Uses GDOS for scalable fonts (NVDI - Bitstream, Truetype; Speedo - Same plus Type1)
+ Can use GDOS bitmap fonts
+ Supported.

Ignoring the cost of say NVDI which is worth buying for its own sake. I would recommend Papyrus
as the better value for money.

Cal does have a couple of features that may swing the balance in its favour

4641. X11R5 for MiNT - retraction

From: Craig Graham <Craig.Graham@ncl.ac.uk>
Message-ID: <3bvgil$3r@whitbeck.ncl.ac.uk>
Source record: 175347

In a posting last week I stated that there was no X-Server for MiNT on the Atari. I must now retract that statement.

There IS a publicly X11R5 server for MiNT - mono only at the moment, and hampered by the lack of VM in the mint kernal, but definitely up & running.

Thankyou Simon Gornall for showing me the error of my ways.

I apologise for misleading last week - it is a rather new development isn't it?

Craig.

Perhaps you'd care to give some real information of Germany's Atari-
scene, then? And not just from Martinsried's point if view :-)

I have been in Germany a few times, read ST-Computer and
it's predecessor ST Magazine - I certainly see that Germany has some
very active companies and users. I also have the impression that the
user base is many times greater than in other countries, and that Atari
is used there in Graphic business more than in any country.
I'm not saying that everybody in Germany uses Atari, but that the
markets there are the most rewarding, and it is quite an equal choice
with mainstream computers in many businesses there.

bw> There is only one stereo codec in the Falcon.

16-track audio *IS* possible with the base Falcon hardware. However,
you can only *record* 1 stereo track at the time. With additional
hardware DA's you can record upto 8 tracks at the time.

bw> > 3) A major complaint of prospective 840AV buyers for digital recording

bw> quality work requires add-on A/D converters, which are quite expensive.

It is not very good - true. But the Falcon hardware is made with this
in mind,- it is very simple to upgrade to better A/D converters.
I don't know the mac myself, but from what I read from the above, it
is the *upgrade* that is difficult to perform. The falcon has a port
at the back that directly connects to the internal sound-hardware.

bw> I think one of the problems with the Falcon is that it is a hobbyist

bw> IDE is fine. It is slightly faster than SCSI for most low-end purposes -
bw> no SCSI command and bus arbitration overhead (which add a few millisecond
bw> to the average access time), and the raw bus performance is roughly the
bw> same. (Both well exceed the performance capabilities of most drives unde
bw> 1 GB.) And given the number of compatability problems that many SCSI
bw> implementations have on the PC, it's easier to use IDE.

Yeah, but with IDE, the CPU has to do the IO. With SCSI, you usually
have DMA controllers, which frees the CPU to do other tasks. Like in
Cubase AUDIO; if the CPU had to do all the IO, you wouldn't be able to
get anywhere near 8 tracks of audio without severely restricting the
machine to become *only* an expensive piece of wire between the disk
and the AD/DA converters. Now, as we all (?) know, cubase can
simultaneously (sp?) do hd-recording/playback as well as 64
miditracks, as well as adding reverb/eq/effects, as well as digitally
mixing each channel (volume/panning), as well as tape-synchronizing,
as well as letting the user change all parameters in real-time from a
nice graphical user-interface, or editing a score page, or whatever.
And this can be done on a base Falcon with the sole hardware extension
of a SCSI disk (and the hardware-key from steinberg :-).

bw> Good thing you put in the smiley. Most PC owners don't like SCSI because
bw> it is not low-cost. A decent PC host adapter costs you $100 or more.
bw> SCSI CD-ROM drives are far more expensive than SoundBlaster or proprietar
bw> card interface drives (we're talking under $150 for double-speed SB
bw> interface drives).

Yeah, and you can get a SCSI double speed CD-rom drive for < $150 as well.
That is no argument. Heck, I've even seen triple speed SCSI CD-rom's
for about $150 in mac-ad's. And that was an external CD, with box and
PSU and cables !

bq> SCSI tape backups cost. In the IBM PC world, SCSI is
bw> not a cost-effective option for most users, and it's an option associated
bw> with incompatability problems. (For the longest time, PC SCSI
bw> implementations have not been that great.)

Well, if you have - say 2 GB of disk, how would you backup that on a
250Mb floppy-based streamer ?
If you do serious hard-disk recording, you will need that amount of
disk space. Heck, you probably even need it to run the next version of
windblows/word/excel...
Now, how would you like swapping 10 tapes, instead of just mounting

one DAT tape in your nice little SCSI dat, eh ?

bw> Now don't get me wrong. I'm of the firm opinion that 100% SCSI would be
bw> good thing. It doesn't really cost any more to implement than IDE - the
bw> sole reason that IDE is cheaper is higher volume sales.

And the reason it has higher volume sales, is again the PC-lemmings.
This is just another proof that high-volume != high-quality.

Please, make a lite version.
The *only* thing I want from a GIF viewer is:

a) FAST
b) Does not change resolution
c) Does not change the 16 first colors in the pallette for
resolutions with more than 16 colors.
d) Puts the picture in a GEM window ([ESC] or something for
making it a full screen picture.)
e) Takes the file-name as an argument, so that I can toss a
gif file onto it (or install it for *.gif files from the
desktop), and the picture should pop up, without having to
go through one hundred menus.

Thats it. Nothing more, nothing less.
This way it would really be useful in a multitasking environment.

Hope you will extract such a lite version from your full-fledged prog
one day.

RiscOS is nice, and easy to use (check all the under 12's who use it in the
UK) but I wouldn't go as far as to say it's as good as NeXTstep - because
it just isn't. It lacks the integrated feel, and the raw power - in fact, until
the release that came with the RiscPC (ARM610 CPU), it could only use
up to 0.5Gig of drive space in total, making it totally unsuitable for large
scale uses - this was not a hardware problem as we have a lot of Acorn R260
workstations here running RiscIX (ARM Unix), just a flaw in the OS.

How do you tell MiNT to use "/" instead of "\" as file separator ?
And also, does anyone know if the new MiNT version just released includes instructions for the 68030, or do I have to compile the sources in 68030 mode ?

Thanks.

Jean-Marc.

Most important of all, _NO_ custom chips. Like the ataris DMA chip.

And the concept should be built of standard components making third party solutions available and making upgrades and evolution possible.

: fine, and with Selectric 1.10 you can do multiple sends with it.
: It works also in background inside Connect.

Not that I know of, but then again, I don't use Connect, so I can't use its Zmodem. I have tried Connect's zmodem, however, and it appears quite good, although I think GSZRZ's display is easier to read and more informative. So if I did start using Connect as my main program, I'd probably use GSZRZ rather than the internal because I already have the registered version of GSZRZ.

Absolutely, ST Format seems of recent to be a very shabby publication,
put together with little regard for journalistic
standards (i.e. telling the truth). They frequently present
misleading or down-right wrong information. Alternately ST Review
appear(s/ed) to have been well-considered and thoroughly researched
by people who were enthusiastic about their subjects.

:journalism and articles reflected this well, sure they never had the
:DTP : and layout jazz that Future Publishing magazines
:have, but that is all : cosmetic when it comes down to it.

Once again I agree; they may be slightly more restrained but at least
ST Review tri(es/ed) to be different. On reflection I prefer
ST Review's layout - lots of information as opposed to STF's loads
of c***.

: know it. Does this sound extreme? Do I sound
: out-raged? Good. Because : I am.

It's crazy! Jaguar is just getting a good collection of games,
Atari shares are rising again , all sorts of brilliant DTP, DTM and
DTV is coming out for the Falcon such (e.g. Digital Sound Module,
Chroma Studio etc, all sorts of graphics and D2D programs). Several
companies are producing clone TOS-type machines independently. If
they (had) hung on till TDSM (had) come(s) out I reckon STR would
(have) experienced a sudden revival. I maintain that TDSM is the
Falcon's killer application (apocalyptic with an Audio Out

modification). I hope Future are watching.

The superb magazine - ST Review - was recently sold off and purchased by
Future Publishing. From what I hear Vic Lennard tried to put in a bid

* I'm surprised that there's any market at all for ST magazines, since as
far as I'm aware, Atari Corp. doesn't even manufacture personal computers
any more (although I have heard rumors of possible clones.)

(3) There will be less coverage of Atari in the main stream press, with

* How can you have less than zero coverage? That's mathematically impossible.
Atari machines haven't appeared in any computer publications that I've
seen in years.

Perhaps it was business sense on behalf of Future Publishing, I mean why
not purchase your only main rival and close it down - means a sheer
monopoly for you. Perfect business strategy if you ask me. But they

* If any magazine wants to publish on the topic of Atari computers, they ought
to be commended. If they have a monopoly, it's because there is so little
interest from other publishers and not enough business to support more
than one publication. It's called the free market system. Apparently, the
market for Atari magazines has shaken out to the point that there's only one
left. That they have a monopoly is their only reward for taking the risk
of publishing a magazine devoted to a not-very-lucrative market. Folks who
don't like it have an option, at least if they live in America. There's
something called freedom of the press, and they can publish their own
magazine, if they think they can make a go of it. --Mark van Wyk

>
>Isn't this similar to what happened with the Sinclair computers? One
>mag was left....and then none...as there were veryt few Sinclair
>computer owners left.

Actually, you'll probably be surprised to know (I was) that "Your Sinclair" is still being published today. I saw it a couple of months back, tucked away on the computer mags shelves in the main John Menzies in Edinburgh. I had to have a look, having been a Sinclair owner back in it's heyday.

It's quite amazing. It's all the same inside, but only it's very thin (even thinner than STR started to get at one point), and it's about the same price it used to be when it had in excess of 100 pages. It got me thinking, having read about the demise of the ST-Magazines, exactly how similar the fall of the Atari is to the fall of the Speccy.

Back in the eighties, when the Atari first graced the scene, it was the machine to have. There was a slight struggle between Atari and Amiga, which eventually resulted (I think) in the Amiga coming out on top, but I'm looking back to the days before that, when the ST was *it*, and us poor Spectrum owners would look in awe at the 16-colour-different-colour-every-pixel displays.

I think it's fair to say that it's bound to happen. Technology changes, and eventhough the Atari range could have been something, Atari corp made certain that it didn't. The Falcon is great as far as it goes, but the prices are similar to those of the PC, and at least with a PC, you can expect to actually get some support, and know that there are magazines, and other things out there, and that you are not going to buy a computer, and realise it is outdated the next week (OK, perhaps this is a little inaccurate as far as PC's go).

I think it's just part of a natural progression speccy -> C64 -> ST -> Amiga -> Mac -> PC -> ???.... (Read Mac and PC at same level). It's the simple fact that things change with technology, and the ST was bound to die at some point.

Now. Having said all that (I can see the flames coming), you may ask, why do I have an ST. Well:
While it is no longer the forefront, and it is certainly dead or dying, I keep my ST for the same reason I kept my Spectrum. After Atari gives up support, after all the magazines die out, it is the users that make something like the Atari live on. And that's important. You only have to look at the fact that the Atari has some very good quality Shareware and PD. This means that, even if software is no longer produced for the ST (It *will* happen someday), the Atari will still be very much alive.

> scene, then? And not just from Martinsried's point if view :-)

Um, although I happen to work in Martinsried (near Munich, BTW), that's
not my only point of view.

Example: try to get the ST Computer (IMHO the best German Atari Mag,
although it has lost quite a bit) somewhere. A year ago, it was
available at most supermarkets or kiosks. Now the nearest shop I
know of which stocks it is about 20 min drive away.

There is very little serious usage of Atari computers going on here
anymore. Of course, the few left are hailed by the remaining Atari
magazines :-)

Try to get Atari software or hardware. Most vendors have abandoned
the Atari platform completely, especially the big chains (ProMarkt,
MediaMarkt, to name a few).

Two years ago, Atari was mentioned quite regularly in the really
good computer mags (I think mainly of the c't which is far the
best one in Germany, although mainly focused on PCs). This happens
only rarely now.

It might be true that compared to other countries the Atari user base
(and software base) is still strong, but it is seriously diminished
from what it was a few years ago. I would strongly object to your
sentence that Atari is "quite an equal choice with mainstream computers
in many businesses" in Germany. This is simply not true any more.

This is not intended to be a flame, it's just to put some things right.

(Maybe I should also add that I own a MegaSTE :-)

>so much selection for word processors (and I already know how to use
>word perfect and microsoft word)... I use Word Writer ST right now but

After being an ST owner for ~5 years and a writer both, I've discovered
that there is no way to do serious writing on the Atari ST. When compared
to the PC or Mac, the ST has nothing to offer that can even hope to
compete with Word for Windows or Word on a Mac. I'm sure I'll be flamed
for saying this in the ST newsgroup, but it's sadly true.

I used to use Word Writer daily, and tried switching to a few new
applications because I became tired of the clunkiness. Although
Calligrapher had more features, I hated the way it used it's own cheesy
fonts and layout. Adding graphics to documents looked good on the
screen, but terrible when printed.

I can't speak for Papyrus, but if you're still using a 16bit ST there
will probably be nothing out there to compare with Word.

I would advise you to stay with Word Writer because with good screen
accelerators it's fairly usable, and while you're a student it's much
cheaper than a PC or Mac. A "new" word processor for the ST will set you
back a fair bit of money (for a student - unless somehow money is no
object) and you will probably not be pleased with what you find,
especially if you expect something like Word Perfect or MS-Word.

NVDI will do wonders for Word Writer if you don't have a screen-speeder
yet.

Don't worry I intend to run Linux. However having bought a PC there is no way I'm *not* going to install DOS and Windows onto it. This gives me access to a massive software base - which might be 99.9% rubbish - but the 0.01% is quite a lot of stuff. OS/2 is nice - but I'm not bothering with it just now.

> Now, if they'd just bought a SCSI system, adding the CD and the tape
> backup (and another hard drive or two or three and a SCSI Ethernet
> interface) would've been VERY easy and painless.

You read my mind. Appart from the initial IDE drive *everyhting* else will be SCSI.

It a pity that SCSI tape drives are so expensive. A WangTEC 500Mb costs in excess of 400ukp new, and a DAT drive costs in excess of 600ukp!

A Colorado Jumbo 250 PC tape drive (250Mb with compression) costs under 100ukp. (all prices *excluding sales tax (VAT)).

Any tape drive I buy though *must* work on my TT as well, so it has to be SCSI AFAIK.

:-)

Roland.

> ISA bus or 8088-compatibility.

Well I've got a TT to compare my PC to. Which is better? Well the TT may
have an *inherently* newer design. However the PC has the *actual* newer
design. Neither is *better* than the other (except in pure terms of RAM
and HD), but the PC is better supported.

> Not to mention the fact that a PC is disposable technology... if you
> buy "top-of-the-line" components, it'll _still_ be totally out of
> date in two years. Better toss that processor and buy a new one!

Which is why I didn't buy top of the line components. My TT is my 'dream'
machine. It means much more to me than my PC. The PC *is* disposable - and
when the time comes it *will* be junked. A TT is *not* the sort of machine
you just junk.

> A couple of people are writing it for the Falcon. It's already
> released (in 65k colours, with smooth shading... which simply can't

> for the Jaguar, as is the awesome Alien vs Predator.

Fine if you have a Falcon. However a falcon doesn't give me a very good
price perfomance upgrade over my TT. A PC OTOH gives me variety in software
and compatibility, if nothing else.

> But some of us just can't bring ourselves to follow the herd just
> because it's easier. DOS/Windows users are lemmings; if you're going
> to buy a PC, you should at least have the sense to put some useful
> operating system on top of it.

Open up your view a bit. Its not a case of having one computer or another.
I have a TT and a PC. I haven't defected to the PC. Also - yes I *have*
installed DOS/Windows on the PC - but why shouldn't I? I'm also installing
Linux. For that matter I'm installing Linux on the TT as well.

Its too late in the day for Atari owners to get teratorial like this. We
are in a shrinking market. It does not harm to build a few bridges now.

Roland.

4677. Program to log modem connect-time?

Newsgroup: comp.sys.atari.st
Date: 1994-12-06 00:25:28 UTC
From: hallvart@ifi.uio.no
Message-ID: <199412060025.1022.holmenkollen.ifi.uio.no@ifi.uio.no>
Source record: 175285

I'm using STorm, and it works fine, but I'm missing a feature that
will let it time the connect time.
I've been using a stopwatch up to now, but isn't there a better way

By the way, is all support of STorm abandoned or is there a newer version
on it's way?

Hallvard, Oslo, Norway

4678. Help with MegaSTE and hardrive

Newsgroup: comp.sys.atari.st
Date: 1994-12-06 00:26:13 UTC
From: schokman@yarrow.wt.uwa.edu.au
Message-ID: <3c0b35$g3b@styx.uwa.edu.au>
Source record: 175286

I'd appreciate a little help from the cognicenti. I've bought a MegaSTE with internal hard drive. I also have an external case with two hard drives and ICDs AdSCSI installed. The question is can I connect the external drives to the Mega even with the internal connected; if so can I get the system to boot via the AdSCSI?

Thanks

Rick

Of course there are no `other tasks' under DOS, TOS, or MiNT. ("yet" on MiNT).
Linux, on the other hand... ... ... okay, okay, I'll go away!

(Don't worry, I'll still be generating GEM NetHack)

I'm happy to tell you that AGGRESSIONs latest project, a splendid shoot'em up game called STARDUST has been finished. STARDUST offers you not just the most impressive piece of coding but also unbelievably realistic ray-traced graphics and high quality multichannel stereo music and effects. Of course all this is crowned with an impeccable playability! STARDUST really pushes your ATARI to its very limits!

Stardust is available for STE and Falcon. It requires at least 1Mb of memory and a colour monitor/TV. EMail me for more information...

AGGRESSIVE IRC PARTY! FRIDAY THE 9TH OF DECEMBER 1994!

4692. Captain Blood cheates...

Newsgroup: comp.sys.atari.st
Date: 1994-12-06 09:31:11 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <3c1b0v$gkp@golem.wcc.govt.nz>
Source record: 175218

Well this is part of a big cheat file by Zenobot's....

Captain Blood (Infogrames): during hyperspace, hold down the left mouse button, and right-click repeatedly. This will shorten the hyperspace sequence.
And now, the complete walk-thru:
Go see Buggol (Planet Mind 137). Land and tell him "me want vote". He will tell you of another Buggol called morlok who lives on planet Rosko 1. Keep talking until you get the coordinates. Go see Morlok. Say to him:" me not vote Morlok, me want Yukas president". He will give you the coordinates of a planet called Female 021. Go and destroy it. Come back to Rosko 1. He will now give you the coordinates of a planet where an Ondoyante is kept prisoner (you didn't need to go there, though...). Go to exterior view and destroy Rosko 1. Go back to Mind 137, and go see the Buggol. He now dislikes you intensely, and will give you the coordinates of Rosko 2. Go there, and teleport the Buggol into your ship. Find an uninhabited planet, and teleport him there. He will say the planet is good-looking and, if you ask "me want know coordinates planet number = Blood", he will give you the coordinates to find number 2.
Go there, land, and say you like him, and will not kill him. You must also get three sets of coordinates from him before disintegrating him (having made sure you saved the game beforehand). Now go around using this method to get the coordinates out of the numbers, always killing them before you move on.
Kill the last one, and you win!
That was the walk-thru. Now here's a trick: at the start of the game you will automatically be in orbit around an alien planet. Transport down and try to find an alien, preferably Yuko, if it isn't Yuko, it may be best to restart the game as he is the key to the game. Talk to Yuko about his father, Maxon, and you will find he is in prison. He will also give you the coordinates for Croolis Ulv, where you will find another alien. While you are talking to Yuko, he will give you the code 1010; this always remains the same. Go to Croolis Ulv and you will be given the co-ordinates for Croolis Var. Go there and destroy it, then go back to Croolis-Ulv. The alien will now be nice to you, keep talking to him and you will get the coordinates for the Forbidden planet.
Go to the Forbidden planet (Sinox), and you will meet a guardian robot. Give him the code you received from Yuko. Now watch what happens.

I will post the rest of this file on Hensa, but I think
Danny is away for 2 weeks....

You apparently have not looked into Tempus Word. IMHO far better than
Word of any kindred. (Can't compare to Word Perfect.) Unfortunately
there is only a German version available (how often has this sentence
appeared in this newsgroup before?), that's why I hesitate to recommend
it.

: transfer rates.

Excuse me, but am I missing something here?

This is the group for comp.sys.atari.st and not comp.i.love.my.pc ?

Just recently it is getting very PC oriented.

Simple really - I own an ST whereas other people own PC's.

Big deal !

If you are not happy with what you've got and can afford to then
CHANGE!

If you are happy with what you've got then stop whinging about other
peoples machines.

4697. Gemini2/Geneva

Newsgroup: comp.sys.atari.st
Date: 1994-12-06 10:31:20 UTC
From: stephen@cavendish.co.uk
Message-ID: <stephen.786709880@unix>
Source record: 175425

Hello,

I've already mailed a couple of posters, but I thought I'd
put something on here too.

I've just got Gemini2 and Geneva running on my *old* STFM.

Spec: 14MHz 68000
4Mb RAM
TOS 1.02
Blitter

Monochrome Hi-res

Geneva (first release)
Gemini 1.999

AUTO Folder:
FATSPEED
PINHEAD
AMCLIGHT (Where is this in Gmni 1.999 ?)
CONSBUGFIX (Do I still need this?)
GENEVA

Geneva RUN :
run setmouse
run QUICKST3
shell Gemini
ACC :
PROMOUSE
TASKMAN
CHAMELEON * 2 (Can Gemini -> Geneva do this now?)

A few problems :

a) .RSC file in German, working on English version, but would
really like to get hold of the docs in English too.
b) Gemini passes the run application names back to Geneva OK, but
the paths of .RSC and data files are not passed. Therefore some
programs terminate.
c) The font in all dialogue boxes is too big and looks ugly.
d) How do I get Universal Item Selector III running under Geneva?
e) What are GBOOT001.APP and *.GIN files?
f) What does the 'Alles Aus?????...' option do in the menu?

I really could go on and on... :)

Anything anyone could tell me about Gemini 1.999 would help -
my German's not very good!

[Fenster = Window, Schlieben = Close, Abbruch = Cancel,
uber = about, ... and that's about it really!]

Regards,
Steve Hobley

Hello.

First, let me tell you I like my Falcon. A lot. But what *really*, *REALLY* annoys me is the fact that I can't show it off to my friends. I used to have it connected to an old TV, and thus was able to show them rotating, texture mapped cubes, real-time fractal flights and all that. But now, since I (apparently) `downgraded' to this whimpy 17" trinitron multisync, I get SICK AND TIRED of all those demos and games refusing to work. The only demo thus far I was still able to run was qad3dvga, and that doesn't really take my Falcon to the limit, does it?

I can't understand how they made the same mistake as they did with the original ST, about having to use two separate monitors. In all my discussions with my friends about the ST's superiority, this argument *always* came up.

So please tell me there's some kind of fix for this. I already tried Rezfooler. It _will_ let me run the demos, but the screen is often garbage. I will even go as far as a hardware solution. I know there used to be `scanners' allowing for ordinary TV on monitors, but I sadly guess that these monitors would have to be able to sync downto 15 kHz, like the NEC 3D. Do such things still exist? I'm so tired of this, I would even pay lots of money for one, just to be able to run anything on my HD without thinking very deep whether this particular program needs a TV connected in order to run, or wants BlowUP out of the way in order to show anything else than garbage.

Oh, and one would expect that in the time of Falcons, Video cards and such, applications stumbling over my BlowUP could only be `my first GfA program' by a 12 year-old. But there are still *lots* of programs having trouble with this.

Sigh. And sorry. I'm just sad and tired.

Regards,

> get the system to boot via the AdSCSI?

AFAIK it should be posssible. Just remember that the internal SCSI-interface is CRAP and you can`t connect more than one unit to it. Also the connected unit must have SCSI ID#0 in order to be recognized by the interface. Since you would like to boot from one of the external drives you probably want one of them to have SCSI ID#0 instead, right? Have a look at the small daughter-board inside your MSTE (the one that the SCSI-cable originates from) and you will hopefully see 3 (red) dip-switches. With these switches you can remap your internal SCSI-unit to another ID. By remapping it to f.e. ID#2 and setting the external drives to ID#0 and ID#1 you should be able to make the computer boot from one of the external drives.

BTW, I think that modern SCSI-driver software can set auto-boot from any drive in the chain, removing the need to remap the internal unit.

Hope this helps!

While a PowerPC certainly would be nice, note that a PowerPC computer
which does not adhere to the PREP standard (or its successor) would
probably not be accepted by the marketplace. At least it would be
a difficult marketing feat.

> >A decent resolution - 1024X768 in _colour_ would be fine. And continuing to
> >have screen memory _anywhere_ in memory and not just on a graphics board like
> >those _other_ computers we Atarians love to hate =8-]

I also think this is a bit of an illusion. The one thing I'd like to
see is a ultra-lowcost 3D graphics computer. 3D graphics need hardware
support to run at a bearable speed, but you could probably do a lot with a
selected set of graphics functions, without implementing the full
3D graphics pipeline. The PC world is currently about to enter the 3D
arena, with the first 3D graphics boards arriving, so it's not too
late yet.

From: et94drw@exeter.ac.uk
Message-ID: <D0E43H.52J@exeter.ac.uk>
Source record: 175428

I have just read this terrible news. I could have almost died when I heard that ST User (the original ST mag) had disappeared, now I can't believe it. Only weeks after the ST Review "now incorporating ST User" came on the shelves, it's buggering off! ST Review was the only mag to take the ST seriously not like ST Format which seems to take the ST for granted. I will miss this excellent magazine and a huge gap will be left in my reading life. I am deeply saddened.

Yours Fed-up-ly,

Dave.

4717. Falcon-spesific XControl

Newsgroup: comp.sys.atari.st
Date: 1994-12-06 13:11:35 UTC
From: josk@lise.unit.no
Message-ID: <3c1nu7$b9d@ugle.unit.no>
Source record: 175429

The General CPX I got with my Falcon does not look like the one mentioned in the manual. I can't turn on/off cache and blitter, the options are missing in the CPX. I would *really* like to enable the blitter :-)

Can anyone help me with this?

4718. 030-LaTeX for Falcon?

Newsgroup: comp.sys.atari.st
Date: 1994-12-06 13:13:58 UTC
From: josk@lise.unit.no
Message-ID: <3c1o2m$b9d@ugle.unit.no>
Source record: 175430

Have anybody compiled LaTeX for Falcon? I've got the TT-version, but it does not work on my Falcon. I would really like to see a version with 030- and perhaps even DSP-support.

4719. Atari - Dream machine.

Newsgroup: comp.sys.atari.st
Date: 1994-12-06 13:33:21 UTC
From: josk@lise.unit.no
Message-ID: <3c1p71$b9d@ugle.unit.no>
Source record: 175431

Somebody in this newsgroup (Can't remember who.) said that they wanted
the graphics/sound-system to use the same RAM as the rest of the system.
This is positive when it comes to the actual programming, but it has one
huge drawback: Speed.

When I switch to 880x480x16 on my Falcon the CPU-performance decreases to appr.
90% (Gembench) compared to 640x480x2 thanks to the heavy bus-load. 256 colours
is even worse, and 16-bit... Btw. that's why 16-bit-graphics is not possible on
VGA-monitors in 80-column mode, the bus is simply not fast enough. If you
install
the Speed Resolution you can use 16-bit/80 column, but the rest of the computer
slows down to almost unusable speeds.

What we *really* need is some sort of compromise, like on the Amiga or TT.
Up to 32 megs (No let's say 'unlimited'.) of 'chip-ram' which can be used by
all the chips, and a 'unlimited' amount of 'fast-ram' devoted to the CPU, FPU
and SCSI-bus.

The important bit here is that the CPU, DSP and the rest of the shit *must* be
able to access the 'chip-mem' like we are used to on the ST/Falcon, otherwise
we get a lot of uneccessary data-shuffling like on the PC and we're getting
nowhere... The fast-mem will then be used for CPU-intencive tasks that's not
graphics- or sound-related (Like a lot of OS-rutines, background disk-access,
raytracing (That's *math*, not gfx :-), compiling...) and therefore *not*
slowed
down by graphics, sound or other I/O.

4720. File-formats for Atari ST/TT/Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-12-06 13:46:33 UTC
From: josk@lise.unit.no
Message-ID: <3c1pvp$b9d@ugle.unit.no>
Source record: 175432

Perhaps I'm a bit oldfashioned but I like TOS 4.04 a lot :-) It's let down by not having background disk I/O, no background printing and no real task-switching, but these features can easily be added using Kobold, alternative
desktops and a multitasking kernel. (Not much 4.04 left...)

What I miss, and actually need, is better file-compatibility. Sure, there are some *TOS*-standards like the 1WP-format, Degas-formats and so on, but let's
face it, when it comes to PC-(No flames please)-file-compatibility it lacks a bit. The graphics- and sound-department is OK by now, but why not use for example
the Word-format for wordprocessors and Lotus/Excel-format for spreadsheets? Now I have to use either RTF or special programs to convert, this should not be necessary. Mac and PC-software use the same formats, so why can't we TOSsers have this? Technically it shouldn't be too difficult...

I would like to hear from some programmers out there about this. IMO, standard hardware-interfaces (For HDs, printers, modems, joysticks, midi...) is nothing compared to standard file-formats when it comes to market these excellent computers!

In the latest issue of ST Review they reviewed a PD module for Calamus SL
that printed out a typeface sheet automatically.

Is this on any FTP site anywhere? (I haven't found it yet)
Or does someone have it to upload to an FTP site (or me).

Cheers,

Apart from the fact that Atari do manufacture machines (they're just not designing new ones), why would a lack of manufacture mean that existing machines become unused overnight?

>* How can you have less than zero coverage? That's mathematically impossible.
> Atari machines haven't appeared in any computer publications that I've
> seen in years.
PCW, the biggest UK mag (I believe) often features short reviews of Atari stuff. The current issue reviews Janus. Recent issues have reviewed music stuff for the Atari Falcon.

> It's called the free market system.
Thanks for your useful contribution. Not.

4726. CLAv2r3a Digital Developer DEMO VERSION

Newsgroup: comp.sys.atari.st
Date: 1994-12-06 14:41:50 UTC
From: Craig Graham <Craig.Graham@ncl.ac.uk>
Message-ID: <3c1t7e$669@whitbeck.ncl.ac.uk>
Source record: 175434

Someone mailled me the other day to say that I hadn't updated
CLA in well over a year. I have, but only registered users have
recieved the updates. Unfortunately, this means that the current
generally (ie free) version is rather outdated. So folks know how
much progress CLA made in it's v2 incarnation, I am uploading
a demo of the current version which my registered users have.

This was the last update of the v2 code, as v3 is a re-write from
scratch.

Limitations on the demo:
========================

You cann't SAVE designs in this demo (so if you aren't going
to register, don't throw away v2r1 'coz I left save in in that
release). This is the only thing I've disabled in the demo.

The new versions of the CLA-VHDL compiler & FSMedit state machine
designer are not included in the archive.

Where can I find it?
====================

You should be able to find it on ftp.uni-kl.de & micros.hensa.ac.uk
later today (I'm sure it'll hit a.a.u.e eventually, but I haven't
got the patience to actually put it there myself).

Craig.

At least you have an Atari dealer or shop to go to..
Atari Oz closed their doors months ago (hot on the heels of Commodore)
and their only real dealer to my knowledge shut up shop a couple of months ago
too!

There are perhaps 20 to 30 Falcons in the whole of Australia!
HOWEVER... my Falcon does all I want in this land of PCs and I can get all
the software I need by mail order from US, UK or Germany.
The NET and the local Atari club (40 or so members?) provide me with all I
require in the way of news and interaction. And ST Applications of course.

Keep computing!

Chris Whitelock

In Atari-system you have *programs* to do graphics, movies, sound etc.
Problem with todays OS's is that they try to be everything from
a filemanager and a movieplayer to a gamesystem.
I was yesterday in a Huge PC-shop, and I checked the OS/2 - there was
nothing revolutionary or innovative in it, right from the mouse-feel
it felt like using a PC-compatible (with constant disk-access even with
simplest operations). And in 486/66 it played Mpegs still much slower
than my odd birdie.

>Well MiNT would seem to be the answer to most OS problems, if only Atari
>unerstood that and build a nice GUI around it..

Would you please give a some sort of a description of MiNT, as many of
us have no idea of it's capabilities (graphics, programs for it, hardware
requirements, SCSI? etc.). Thanks!

Learning some new languages is no bad for people. AFAIK all of us who
write to these Newsgroups are not from english-speaking countries.

And the dictionaries in the new generation of programs can be taught
(Tempus Word can be taught, and so can Papyrus (Papyrus learns words
directly from imported texts, and it uses many dictionaries at the
same time). Also both of these programs support national characters.

The budget doesn't really extend to STreaight Fax at present. I recently
used CoMA a german shareware program, as it suggests it was all in german
and I didnt understand a thing. Is their an English version of it?

Something is screwed up with my news server here and I no longer have read access to comp.sys.atari.st <sniff> although I can still post to the newsgroup via a gateway. Why I can still read the other atari-related newsgroups is a mystery to me. So, if anyone wishes to contact me, please do so via email to hutch@ilmen.lanl.gov or hutch@genie.geis.com until I get this problem sorted out, if ever.

As usual, flames will be directed to alt.trashcan. :)

Cheers and Happy Holidays to all!

4742. Atari FTP list

Newsgroup: comp.sys.atari.st
Date: 1994-12-06 16:50:36 UTC
From: msh@mserv1.dl.ac.uk
Message-ID: <3c24os$3i8@mserv1.dl.ac.uk>
Source record: 175203

No updates unfortunately but I'll post this once a month! - Mark
****
IMPORTANT NOTICE!!!!!!! IMPORTANT NOTICE!!!!!! READ THIS!!!!!!!!

As I will lose free Internet access soon (in about a month's time) and will
no longer be able to search and test endlessly all FTP sites any more, like
I have done so far, I will now hand this list over to Mark Smith in the UK,
so that it can be further updated and posted. I might be back on the net
later, and take over again (or do it in co-operation with Mark), but as of
now Mark Smith (msh@dl.ac.uk) will handle everything concerning this list.
So, write to him if you have any updates or new sites etc, and not me.
See ya!

Hallvard, Oslo, Norway

PS. Thanks to all for your encouragement and support!!
Good luck Mark!

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
--------------------------------
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
```

7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.
Use the appropriate decompression program for this.

- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

Part of this is dependent on you having the GNU msdos-utilities available
at your site. If you don't, ask your local system operator how to transfer
files to/from MSDOS disks.

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:

- mdir [CR] to show disk-directory/space left.

- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)

- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")

- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt test1.zip"

- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

- eject [CR] to eject disks from disk-drives that don't have "eject buttons".

>the limit, does it?

I'm too sick'n'tired for downloading 10 megas of demos and games just
to see that thay don't run in my 17" MAG multisync.
Also, making programs run only in specific resolution and colour mode
is equally annoying. (Example: a game called SHIFT..)

I had similar problems with my SM194 and MegaST - I had two monitors
just because there were so many bad programs there.

It's also Atari's mistake: they should have made only a couple of
good resolutions, and not 35 bad, which make you get a ScreenBlaster
the next day you buy the machine (but after that it's OK).

> I can't understand how they made the same mistake as they did with
>the original ST, about having to use two separate monitors. In all my
>discussions with my friends about the ST's superiority, this argument
>*always* came up.
> So please tell me there's some kind of fix for this. I already

Best fix would be that programmers would realize, that there are two
ways to connect the Falcon, and there are also multisyncs which do
not go below 50Hz - and make programs according to those assumptions
(as good programmers always have made).

> Does Elite II run on the Falcon. Also does it have inproved graphics?

Yes it does - the frame rate is alot faster so it is much nicer to play than on a normal ST or alike.

You don't need to run an ST emulator like backward as all the system calls made by Elite are legal! - just make sure that you don't have any extra accesories installed as this wiil cause it to crash! i.e. only control panel

Both the blitter and the caches are turned on by default. I can`t see
why you would like to turn them off. The Falcon is slow enough as it is. ;-)

ATARI CHRISTMAS SALE

Atari STacy laptop computer
* 4 MB in SIMMs, 130 MB Maxtor HD, 16 Mhz AdSpeed CPU, Mega ST
external keyboard ready, joypad, padded carry case
* Atari Mega STe external keyboard
* $700 obo

Atari PS3000 monitor
* 12" color, built in DS/DD floppy drive
* $100 obo

Black Lamp (game)
* $1.00

Atari TrakBall
* $3.00

Buyer pays shipping and handling. US only.

Huh? It was my understanding that Papyrus Gold wasn't compatible with
Speedo5 yet, but HiSoft was working on it. Have they gotten it compatible
yet?

4753. SLM-605 Laser problem, any suggestions?

Newsgroup: comp.sys.atari.st
Date: 1994-12-06 17:53:56 UTC
From: peterw@io.org
Message-ID: <3c28fk$qnv@ionews.io.org>
Source record: 175214

Like the subject says.... lately my slm605 has been having problems printing on a specific portion of he page. There is an approximate 1/8th inch line that runs up the page, especially over dark print. It is not a black line, but rather a light portion that dosn't seem to be getting enough toner. example: if I were to print a completely black page it would look like the following (the *=black) ** *********
** *********
** *********
** *********
** *********
** *********
The unprinted section is always in the exact same place on each page. The last time I replaced the drum unit was around 3,000 printed pages ago, so I doubt the drumb could be fried already. I've cleaned most of the parts I can reach and even tried printing with my old drum. The annyoying line remains even with the old drum unit.

If anyone has any suggestions, they'd be greatly appreciated.

Thank's

I would go for That's Write 3. I haven't found any bugs, and it will use Speedo fonts. Some come with the program, and you can get the Wordperfect pack of Speedo fonts. They need a bit of care installing, but then work OK. You could choose the simpler That's Write 2 (or even the baby of the family, Write On). TW2 has bitmapped fonts, so you have to instal different sizes if you want them, whereas the Speedo fonts of TW3 are scalable. WO doesn't have a spell-checker, but is otherwise pretty good.

I never liked Calligrapher, though it has some advantages. But best not to get a program that's no longer supported. There are also Papyrus and Redacteur, and I'm pretty sure demo disks are available for them.

MagiC is an operating system for Atari hardware. MagicMac is an operating
system *extension* for Apple hardware, which enables it to run TOS
binaries; it runs on top of MacOS.

It's getting better again. Recently Germany's Atari-users mailbombed a TV
station to catch their attention. And it worked. They showed some Atari-stuff
in one of their recent shows. (The people they invited into the studio weren't
that great, though. E. g. Theo was there ...)

>Try to get Atari software or hardware. Most vendors have abandoned

There are still quite a lot dealers active. Look into the ads in the STC. Of
course there aren't as many as before. But hey, only the strong will survive ;-)

>from what it was a few years ago. I would strongly object to your
>sentence that Atari is "quite an equal choice with mainstream computers
>in many businesses" in Germany. This is simply not true any more.

IMHO the publishing market will grow further, esp. with the new machines
(Eagle, Tx0) and this brilliant piece of software: MagicMAC.

And for private use, the Atari range is still superior to PC's. Look at the
pices one has to pay for decent PC-software. Totally rediculous.

Connecting the external drives to the MegaSTE via the AdSCSI shouldn't
be a problem. Make sure the SCSI-ID's are unique and check the SCSI-
bus-termination.

MegaSTE's internal adaptor onlx handles drives with ID 0. All others ought to
work.

>external drives to the Mega even with the internal connected; if so can I
>get the system to boot via the AdSCSI?

That's a good one. I'm not sure about this. Does the boot-drive depend on the
lowest ID? Then you're in trouble. But I'm at a loss here.

Perhaps you should isntall drive *C* on your external drives. Perhaps that
works.

But why not boot from the internal drive? What kind of HDD's have you got in
the cases anyway? You might change that configuration to fit e. g. the fastest
drive into the MegaSTE (switching parity OFF is mandatory!).

I don't like the QWK format - NOT at all !!!
The format I use is after an idea uses in another norwegian BBS program
for MS-DOS called MBBS... The GRAB-file is pure ASCII-text and the
offliner makes an index when it reads the file - easier than QWK (if
all else fails you can read your messages inside a text-editor...)

Besides... The offliner needed (ReadMail ST) is much faster - and free.

I can't agree on that. There are many very good word processing programs for
Atari computers available. The problem is that few of the best ones work very
well on an ordinary ST.. 8 MHz computer is a 8 MHz computer - can't help it.
Try using WinWord 6 on a 286 PC ;-) !

Here are some programs worth trying:

* Papyrus Gold (very Word-like, positively - and VERY good...)
Requires 2..4 Mb RAM, SpeedoGDOS, and a hard disk for serious use.
Works well on Falcon, but might be a little slow on a ST.
My personal favourite, and the support is excellent.
English version available from HiSoft.

* That's Write 4. A bit different concept, less DTP-oriented, still
quite capable in that area, too. Don't own that myself, but version
2 I used years ago, was very good.. Supports Speedo, Falcon, etc.
English version of TW 3 available, version 4 probably coming soon.

* Script 3. Another very easy program to use. In fact, from what I have
seen from version 2 earlier, it's a joy write with. Don't know if there's
an English version yet - but it should be easy to translate the RSC-file.

* Protext. For really heavy professional writing, many people say this is
the program... Not much graphics and such stuff, but it's bloody fast,
and able to do all kinds of weird things serious writers need to do.
English.

* Signum 3.5. I've seen the demo - and THAT was impressive, if anything!
This might be the program to rival every PC or Mac word processor. It's
huge - filled with features, and clearly meant for professionals. In fact,
Signum was originally written for university people, if I remember that
correctly. If somebody translated this in English, I guess you wouldn't
have a lot to complain about for some time ;-) ! How is it, you German
people who read this? Why isn't Application Systems Heidelberg interested
in Signum's international releasing? It's time, I think.

* Tempus Word 2.9. Another VERY heavy and extremely capable professional
program. So filled with features that one can get lost ;-). Still, very
fast and handles graphics well, too. I got version 2.1 junior (there are

3 versions available) from some magazine cover disk years ago. It was impressive, I can say. The only problem: that language..... =-(

Then there are CyPress, some new program from Germany (don't remember the name - sorry), etc.

I really believe that there is a program for you, too. Most of those I mentioned, can read and write RTF text format too, so it's possible to use the documents in both e.g. WinWord and your Atari program.

Greetings,

Tommi

(a serious writer, too..)

It's not Atari's fault this time.. It's the programmers. Falcon is very capable of doing things from 15 kHz TV screen upto 70 MHz pixel freq (something like 1024 x 768 x 16, 70 Hz non-interlaced..). The latter with external video sync, though. The freedom that Falcon gives to programmers unfortunately gives them also lots of chances to screw things up. It _is_ very possible to write demos that work both on VGA and RGB. I know, because there are many around. More all the time.

But perhaps some demo/game coders simply don't own a VGA monitor and thus don't bother to write their code compatible to VGA. It takes some more trouble, but mostly it can be done. And is _should_ be done to avoid disappointed people like you (and me, too).

> the way in order to show anything else than garbage.

I'm afraid there isn't a simple solution. Those programs that sync Falcon down to 15 kHz really require a monitor capable of showing this low frequencies. Few monitors manage it today - but one that does is Commodore's own multisync

(Amiga users have the same problem, too!).

> Oh, and one would expect that in the time of Falcons, Video cards
> and such, applications stumbling over my BlowUP could only be `my
> first GfA program' by a 12 year-old. But there are still *lots* of
> programs having trouble with this.

I agree. Almost all "serious" programs today work perfectly under BlowUp.
The problem is again >:-(those bit-twisters who don't bother to write their
demos/games so that they would check the resolution before running. It's not
Falcon's of Blow-Up's fault. Some new demos/games, however, can do this - so
things are getting better. It must be said that Falcon isn't as easy to program
as ST was, because there are more things to remember... This VGA/Blow-Up
compatibility is just one such thing. When programmers get to know the Falcon
better, the results get clearly better too.

> Sigh. And sorry. I'm just sad and tired.

Play Ishar 2/3, Formula One G.P, Civilization, or NetHack 3.13d GEM - you'll
feel a lot better ;-) ! Things aren't that bad. I own a multisync SVGA just
like you, and have very few problems. That's because I throw every damn demo
away that doesn't work on VGA! Fortunately, most demo/game stuff I've found
during the last 6 months works fine on VGA. So, it seems like programmers have
learned their lessons. At least, let's hope so =-) !

Greetings,
Tommi
(Falcon 4/420, Salora Autosync 44 SVGA, Supramodem)

Warum's a very old Falcon demo. There are much better demos out with better
music.. take a look in ftp.uni-kl.de for a few (quite many actually).

I had to _keep_ all my accessories and TSRs to make Frontier run.
The game code may be cleanly written, but it loads right on top of
everything else! I can't understand why developers keep doing that.

If you use a hard disk driver with caches, be very careful...
I had a couple of nasty crashes before I wrote a small program to run
before all the other AUTO programs. The purpose of the program was to
reserve 1Mbyte of memory for Frontier to do as it wanted with.

>Huh? It was my understanding that Papyrus Gold wasn't compatible with
>Speedo5 yet, but HiSoft was working on it. Have they gotten it compatible
>yet?

Yes, twas me who had to work on it. Fact is, SpeedoGDOS 5 generates negative
font ID's for some TrueType and Type 1 fonts (actually the more exotic ones),
which causes quite a few programs trouble because negative numbers never had
to be expected before there; in Papyrus they were used for something else
there, causing a bus error. There is a workaround since Papyrus 3.53.
Those who encounter this problem can also simply remove the font, and someone
from Compo said there's also a way to reassign font ID's, but don't ask me how.

This problem never occurs with NVDI3 BTW.

>Now I have to use either RTF or special programs to convert, this should not
>be necessary.

We have also considered this, but technically a general format like RTF is
more reliable and has more future. The problem with converters for proprietary
formats of different word processors is that

- documentation is not readily available
- formats of "old" programs are very complex because they have
been extended many times
- next time the word processor's changes it will be outdated

As a result such converters often produce garbage, refuse the file completely,
crash, or just manage to extract raw ASCII text, as I have experienced
in practice.

RTF is actually quite well specified, even though it's from Microsoft. It
allows extensions to be added without causing older readers trouble that
don't know about the later extensions. By now (Spec 1.3) it also supports
essentially all features of modern word processors. RTF allows document
exchange with houndreds of programs out there.

Our concept for Papyrus is therefore to provide a really reliable RTF
import/export and in addition import filters for a few ATARI-specific
formats (1ST Word up to 3.20, Script 2, Signum 2, Cypress).

IMHO the reason why those PC programs often support so many formats
is that "supports 20 Word processor formats" sounds much better
than "supports one document exchange format that actually works"
in advertising.

BTW the spreading RTF support would allow someone to offer a general
converter that can convert RTF from and to anything. Such converters
already exist on other platforms, i.e. MacLink plus. This one
actually works.

I don't think so. The demo works on my TV without any problem.
But perhaps your TV can't do 50 Hz (if I remember, the programmers
told me that the demo runs at 50 Hz, even on a VGA).

> Yeah, but with IDE, the CPU has to do the IO. With SCSI, you usually
> have DMA controllers, which frees the CPU to do other tasks.

There is nothing about IDE that precludes DMA. In fact, I would bet that virtually all implementations of IDE on PC clones use DMA. Like SCSI, it's just a peripheral bus; nothing in the spec says anything about what data transfer method is used after the bits arrive at one end of the bus.

Also, many SCSI implementations use programmed I/O instead of DMA. For example, it's a fair bet that the only mass-market computer which uses SCSI nearly exclusively is the Macintosh. Most Macintoshes do not use DMA for SCSI. (Only the IIfx, AV Centris/Quadras, and Power Macs use DMA for the SCSI port. And the IIfx doesn't quite count, since its DMA only operates under A/UX, Apple's old UNIX implementation for the Mac.)

[all sorts of stuff about D2D being impossible without DMA disk I/O deleted]

Irrelevant. IDE is usually DMA-driven. And if your main CPU is powerful at all, PIO is sufficient for any kind of d2d sound recording, which is usually at CD-quality (44.1 KHz 16-bit stereo). That translates to a data rate of about 175 KB/s, which is almost nothing to a 68040 or 486.

> Yeah, and you can get a SCSI double speed CD-rom drive for < $150 as well.
> That is no argument. Heck, I've even seen triple speed SCSI CD-rom's
> for about $150 in mac-ad's. And that was an external CD, with box and
> PSU and cables !

I have never seen a double-speed SCSI CD-ROM mechanism for less than $200. Much less triple-speed - only NEC makes those AFAIK, and they charge you well over $400 for them (not worth it, IMO).

> Well, if you have - say 2 GB of disk, how would you backup that on a
> 250Mb floppy-based streamer ?

You really didn't get the point. Most people don't have 2 GB of disk. If they do, they almost certainly have SCSI - up until very recently, 1 GB IDE was almost nonexistent. I'm talking about the mass market - people with general purpose machines, not power users.

> bw> Now don't get me wrong. I'm of the firm opinion that 100% SCSI would be
> bw> good thing. It doesn't really cost any more to implement than IDE - the
> bw> sole reason that IDE is cheaper is higher volume sales.
>
> And the reason it has higher volume sales, is again the PC-lemmings.

> This is just another proof that high-volume != high-quality.

The reason for IDE dominance in the PC market is mainly historical.
Originally, the only way to connect a HD to a PC was with a MFM/RLL
controller that was more or less a clone of that in the IBM PC XT. IDE
came about as an alternative to this, to move the controller electronics
off of the controller card and onto the drive. It was more compatible
with the earlier standard than SCSI, and SCSI implementations for the PC
were fairly buggy and incompatible in other respects as well (not just
with the computer, but with SCSI devices made by somebody other than the
host adapter card maker). Therefore people chose what was better for them
at the time - IDE. This soon led to massive market dominance of IDE, and
low cost due to high volume.

Calling PC users lemmings does not constitute a rational argument.

What you are missing is that its no longer a case of Atari *or* something else. Many Atari owners are finding themselves in the situation where they own (to intend to buy soemthing else than an Atari).

I quite agree that as this is the main Atari group it should be Atari orientated. It doesn't mean IMHO that we should work in a vacuum.

Roland.

And thats your choice. I personally can't see a use for a current Mac as they look like they will become obsoleted when Apple and IBM get there act together (if not before). PCs will cease to be state of art - but they will hang on like grim death ;-)

However thats not the point. The Mac *is* a bridge in the terms I was talking about. A combination of an Atari and a Mac gives so much more potential than just the Atari IMO.

:-)

Roland.

Hey cool! Somebody who doesn't recognize that having more pixels to calculate and more complex algorithms to calculate them dictates a faster CPU!

If you don't want to play new games with graphics that are impossible on slower CPUs, or don't want to use any kind of new technology to do things that weren't possible on older technology, fine. May I point out that the Falcon is an example of this? It can do many things that older Ataris cannot. Do you object to it, too?

Let's talk about Marathon. At 640x480 with 32768 colors and 20 fps updates, you have to have a memory bus capable of sustaining about 12 MB/s writing (actually much higher because frames are not continuously sent across the bus, but in bursts) and a processor that can calculate 16-bit values for 307,200 pixels 20 times per second. Furthermore, you need another 12-15 MB/s of memory read bandwidth (as a rough guess) for texture, data structure, and program code accesses. Cache may help you somewhat here, especially on the 8100, which has 256K of cache - enough to hold a lot of data and code. All this adds up to a task that is simply impossible for something like the Falcon - its memory bus alone isn't up to it. The processor is what, maybe 5 integer MIPs on a good day? There are over 6 million pixel values to calculate per second, and you need many instructions to process each pixel. You can't hand off the whole job to the DSP, because the 56001's 24-bit architecture precludes high-bandwidth access to main memory, which is 16/32-bit.

All of the above means that, quite simply, you need a processor capable of upwards of 60 MIPS just to do the calculations, and it better have fast memory access to boot. The PowerPC and the Pentium both qualify.

>Both the blitter and the caches are turned on by default. I can`t see
>why you would like to turn them off. The Falcon is slow enough as it is. ;-)

If the blitter is on I see some strange red colour shadows when scrolling text. If that disturbes me I turn the blitter off (this is only possible if NVDI is installed because the internal Falcon-VDI desperately needs the blitter).

Turnig off the cache may be neccessary when using old programs with self-modifying code or if some games run too fast ;-)

There's an SI.CPX (system information) shipped with recent versions of NVDI (since 2.50 I think) which allows to turn on and off the blitter/cache and to switch to 8 MHz ;-)

Hope this helps,

Andre

>2) Cost. IDE drives are dirt cheap so you might as well have one for all
>the boring system files.

Actually, excluding the cost of the controller, the difference is much
less than before. When I bought my last SCSI drive, it was at the same
price as the IDE.

>Actually point 2 is the problem. IDE drives are *so* cheap that you can't
>buy a small one anymore.

Same for SCSI.

>The interfaces are cheaper as well. A SCSI card is 50ukp - 200ukp, whereas
>an IDE one is about 10ukp and its often combined with the IO card.

But what can you do with an IDE interface? Just attach *2* IDE drives to
it. My SCSI controller has a HD, a DAT, and a CD-ROM hooked up to it, and
another HD on the way. Flopticals are SCSI too.

Advancement? IDE can be replaced by EIDE which gives slightly better than
SCSI-1 performance. SCSI can be SCSI-2, which kills SCSI-1 and EIDE.

>Whats the big problem adding a DAT and CD-ROM to an IDE system? My SCSI
>CD-ROM co-exists quite happily with my IDE drive.

If you already have a SCSI controller, you may as well buy SCSI drives.
They are faster under multitasking operating systems (eg. Linux). This
goes for 680x0 Linux equally.

>0.01% is quite a lot of stuff. OS/2 is nice - but I'm not bothering with
>it just now.

I thought that too. But in reality, I've hardly used DOS/Windoze AT ALL.
Of course, it is so very cheap. But for me, it has been a bit of a waste
of HD space (I left 160M free for DOS/Win, and DOS+Win+free ClarisWorks1.0
comes to 90M - waste!).

>You read my mind. Appart from the initial IDE drive *everyhting* else will
>be SCSI.

What a waste! DAT and CD-ROM have no use for the SPEED of SCSI - only hard
drives need it.

>It a pity that SCSI tape drives are so expensive. A WangTEC 500Mb costs
>in excess of 400ukp new, and a DAT drive costs in excess of 600ukp!

Unlike hard-drives, it is quite realistic to buy tape drives second-hand.
(it is foolish for hard drives, since you are buying degraded media,
whereas with tapes, your media is seperate - you have your data even if
the tape drive melts down)

>A Colorado Jumbo 250 PC tape drive (250Mb with compression) costs under
>100ukp. (all prices *excluding sales tax (VAT)).

These things are useless. 250M is NOTHING these days. And the tapes cost
a fortune compared to DAT tapes (2Gb DAT tapes are AU$30).

I am posting this for a friend - please respond to either myself or his address...

I am looking for users of Superbase Professional for the Atari ST, Superbase for the Amiga and IBM.

I am programing in DML for the ST and would like to share knowledge.

Has anyone been able to patch Superbase so it uses either a replacement item selector or the system selector?

Is anyone knowledgeable with the COMMS, ie: Communications programing including a Communications program or a BBS writtenin DML?

Anyone have a 'runtime' or developers kit that is not being used?

I am considering opening a BBS aimed at Superbase users and other cross system programing, any interest in this?

You can send E-Mail to me via AT&T Mail, my address is: !ocleveland.

Any feedback would be appreciated.

The atari floppies are usually formatted exactly as the DOS should (!) be.
Some formatters for ST try to free space by reducing the space for the FATs to
the needed amount, which frees
some KByte, but makes the disks unreadable for DOS and MTools. (Although it is
legal with the microsoft specs!)
But (as far as I know) due to a bug in MSDOS they can not be read on a PC.
So get a new formatter for your Atari (TOS 1.4 will do), so that your disks
can be read on a PC with MSDOS (try this).

Number two, even worse: Mtools have to be configured during compile time
for the formats used. iAnd they are very restricted.
When HD drives were installed in our Pool, they forgot
to install the 720KByte format in the new mtools. (I copied the old one and still
have it in my private bin dir.)
Try to check this (try a DOS 5.0 boot disk, which is 720 KByte)

4800. Should I buy a Falcon?

Newsgroup: comp.sys.atari.st
Date: 1994-12-07 04:30:49 UTC
From: dwallace@wam.umd.edu
Message-ID: <3c3dpp$1f7@cville-srv.wam.umd.edu>
Source record: 175060

Recently, I have been considering upgrading to a Falcon; one of the main uses of my STe is MIDI, and the prospect of running Cubase Audio sounds quite appetizing. However, I am somewhat hesitant to do so, since I don't have a lot of info on the Falcon; my only sources of info are the net and the Toad catalogs I get in the mail periodically.
One of my main concerns is compatibility; I have heard that the Falcon is "mostly" compatibility with earlier models. The software I most use is Flash 1.6, Word Writer 2.0, Sequencer One Plus (MIDI stuff) and various UNIX-like tools (esp. Gulam, Elvis, etc.); I also play with CrackArt a fair amount, as well as a bunch of games I pull out when I'm feeling espescially idle; how much of this can I expect to be able to use?
Also, is there a Falcon spec sheet floating around that I don't know about? I'd like to know what kind of grax, sound, etc. its capable of, as well as what add-ons are available. I'd be interested overall in hearing the gripes and praises of Falcon owners out there, espescially those who are musically inclined... Thanks...

>1) What is the latest version?

Not sure about Creator, current version of Notator is 3.2 (upgrade free from
Emagic - if you don't have their phone #, email me & I'll post it,

>2) Will it run %100 with only 1 meg of ram?

I doubt it, sequencers are ram-hungry. Spring for the 4 meg SIMM's - you
won't regret it (VBG).

>3) Any problems running on an STe?

None that I know of - we run on an STE with TOS2.06 and it's great!

>4) Anything else I should know?

Creator will _not_ print music - only sequence it - Notator prints too.

>Please reply by e-mail only. Thanks!

Nope, sorry, I'm here, you're here and these questions might help others too!

BTW, Notator is a GREAT program, go for the gusto and get it, not just Creator.
I got a copy used for only $200.00 U$. My GF says it's the best sequencer/
notation package she's ever seen - and she's seen plenty! Not just Atari
sequencers either - she says it cuts Performer to shreds!

I do not agree. Custom chips make a system inflexible and hard to expand.
Look at the Atari 1040STf: a computer that is very hard to expand,
because it has e.g. a ROM port. Why not an expansion port??????????

Open architecture is the only way to create a flexible system.

Lets take a car as an example: FORD Capri. There were about 600 different
version. From very basic to extremely custom. And when you would have a
basic version, you could expand it to the most custom version.

I would like a computer for which the following is true when it comes to
expanding it: THE SKY IS THE LIMIT.

Hope you understand the above.

Greetings, Peter

Could someone direct me to a site where I can get instructions on how to setup the atari Linux (with the file list I need) or tell me what I need to do?

I do not have MiNT installed, however nothing in the ANNOUNCE files indicated that I needed it...

L676791@LMSC5.IS.LMSC.LOCKHEED.COM wrote:
: * I'm surprised that there's any market at all for ST magazines, since as
: far as I'm aware, Atari Corp. doesn't even manufacture personal computers
: any more (although I have heard rumors of possible clones.)

Those rumours are true. Atari have had a reasonable amount of computers
sold in Europe, but, as it seems, almost none in the US.

: * How can you have less than zero coverage? That's mathematically impossible.
: Atari machines haven't appeared in any computer publications that I've
: seen in years.

Because there is no zero coverage of Ataroi Computers in Europe. We have
a dutch, a french, now onlz one english, now three german magazines dealing
only with Atari. Mainstream Press, that deals with Atari, too, is, for
example, German magazine "c't".

: * If any magazine wants to publish on the topic of Atari computers, they ought
: to be commended. If they have a monopoly, it's because there is so little
: interest from other publishers and not enough business to support more
: than one publication. It's called the free market system. Apparently, the
: market for Atari magazines has shaken out to the point that there's only one
: left. That they have a monopoly is their only reward for taking the risk
: of publishing a magazine devoted to a not-very-lucrative market. Folks who
: don't like it have an option, at least if they live in America. There's
: something called freedom of the press, and they can publish their own
: magazine, if they think they can make a go of it. --Mark van Wyk

Absolutely true. However, I think everyone here knows how the free market
system works and they also know about freedom of press, so it doesn't
need an arrogant explanative tone to underline your arguments. I think
that Americans (at least most of them;-) also know, that Europe
consists of democracies and that there is freedom of press over here,
too. America is just a part of the world, not the world itsself. If
Ataris are not present in tyhe US, fine, in Europe there are still a lot
of them, there are clones, and the operating system is being cloned and
ported to the Macs (in a much improved version), so there is at least
some activitz going on. The mistake you make and you should not do is
to think, that all the world is like the USA.

Regards,

Alfred

I have made the experience that, for some odd reason, neither mtools
(don't know which version I have ... :-) is able to read Atari
floppies nor Linux is able to mount them, although they can be perfectly
read by DOS. So, the answer is simple: boot DOS (you have left a small
DOS partition, haven't you? :-), copy the files, then read them from
the HD.

>raytracing (That's *math*, not gfx :-), compiling...) and therefore *not*
>slowed
>down by graphics, sound or other I/O.

The Big problem with this is the large address range that these chip will
needed and registers, I don't think this is realy possible, the TT and
the Amiga does not have this....

4824. sound converting program for the ATARI ST/TT/Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-12-07 12:32:10 UTC
From: mppi76@cd4680fs.rrze.uni-erlangen.de
Message-ID: <3c4a0aE96f@uni-erlangen.de>
Source record: 175088
Cross-posted to: alt.binaries.sounds.d,comp.sys.atari.st,maus.sys.atari.software

Five to Five V2.0 for the ATARI ST/TT/Falcon

525 is a GEM based sound converter for all ATARI computers, running under
TOS and MultiTOS. The program is now available in a new version in
german and english.

525 can convert any of the following formats into any of them:

- DVSM (used by WinRec/WinCut for the ATARI Falcon)
- AVR (used by many ST/TT/Falcon programs)
- AU,SND (used on SUN, NeXT)
- WAV (used on PC's)
- HSN (used by CrazySounds for ATARI)
- CIT (used by Fortune for ATARI Falcon)
- Raw (for many other cases)

You can also convert form 8 bit to 16 bit (and vice versa) and from Mono
to Stereo. Also different packing algorithms are implemented.
works on the Falcon.

525 will be available at atari.archive.umich.edu and other german ftp sites.
A version for OS/2 will be available soon, too.

Papyrus is a good package, and can do a lot of what Word does. There
is an English spell-checker (a FAQ!) and it has paragraph styles
like Word.

It can also do discontinuous selections (if you haven't ever seen that
on a PC, you really don't know what you're missing!), and has a *very*
neat spellcheck-as-you-type function, which underlines mis-spelled
words in a zig-zag. It also has a far better interface which doesn't
get in the way like Word's.

Here endeth the sermon.

The PC chipset are after -- customer chips -- for the 486 processor. Atari
could have called their DMA/GLUE etc the Atari Chipset as well.

In article <3c227v$5jh@dux.dundee.ac.uk>, rmccall@mcs.dundee.ac.uk (Rod McCall) writes:
|> What advantages over GEM does GEMINI have?
|>
|> Does it support non-ST screen modes etc? This is of interest to me as
|> I own a falcon.

I'm afraid there's some misunderstanding. Gemini is a replacement desktop - a program which allows you to start programs and to copy files etc. It actually does the same as the built-in Atari-NewDesk but it has got lots of wonderful extensions (VA-protocol, built-in shell 'mupfel', long filenames under MiNT+minix.xfs, support for Kobold - the excellent file copy program...).

GEM is a graphic user interface (GUI). It provides functions to create windows, dialogue boxes, menu bars etc. so that programmers don't have to reinvent everything themselves. GEM is resolution independent (=screen mode independent).

The VA-Protocol support is the most important reason why I use Gemini. I have installed 4 ACCs which understand VA-messages and they make working with the computer very comfortable:

CLOCK.ACC displays a clock in a small window (analogue/digital/both). That's nothing special but you can specify a time when it should chime and send a VA-message to Gemini, telling Gemini to run a shell script. The shell script may contain instructions to run various programs etc.

TAKEOFF2.ACC displays a popup menu when selected from the menu bar or when its icon is double-clicked on the desktop. The popup menu contains up to 32 entries for programs or folders. Selecting one of the entries will run the specified program or open a folder.

1STGUIDE.ACC is a file viewer for text, images, sounds, movies etc. When I double click an icon of a file which is not connected to any application, Gemini tells 1stGuide to open that file and to display it in a normal window. If 1stGuide recognises the file format it will show the file correctly, if it doesn't you can have a look at a hexdump of the file (by holding alt-control when double clicking the file).
In case 1stGuide already opened a window you can simply drag an icon onto 1stGuide's window and display the file's contents in it.

APPMAN.ACC is an application manager. The idea behind it is that almost every file can be shown, executed, edited or packed in some way. If APPMAN.ACC is installed a double click on any filename will show a small popup menu with the options to show, edit or execute the file. The programs which should be used to do this can be specified for every type of file.

There are other programs/ACCs which support the VA-protocol, such as GemView or Imploid and even some 'normal' programs like text editors understand it (7up, QED 3.2).

Hope this helps,

Andre

|>
|> And do you have ANY Fast-RAM (TT-RAM)???? That is the interesting part of
|> it... I Would like to see what kind of numbers you would gain then ;^D
|>
|> //Robert
|>

No, I'm sorry I have no FastRam, but there ist a FastRamCard for the PAK3 and it seems to be very fast (if you are able to read german Groups, then try maus.sys.atari.hardware there are many PAK3-Users and also there ist Holger Zimmermann (he developed the PAK3))
Perhaps I'll buy a FastRamCard but I think not bevore February...

You have to use SIMMs with 60ns if you have a PAK3 with 50mhz so I think that the speed can't be too slow. I know that the access-time is not necessary with the speed but there are some Users in maus.sys.atari.hardware and they say that the speed is fantastic....

|> have a lot to complain about for some time ;-) ! How is it, you German
|> people who read this? Why isn't Application Systems Heidelberg interested
|> in Signum's international releasing? It's time, I think.

I'd say the English speaking Atari market hasn't been important for ASH (Signum always needed a high resolution display i.e. 640x400 at least). Unfortunately, American and British Atari users were more interested in games than in professional programs so they mostly had (or still have?) low res monitors, few memory and harddisks. The Atari reached a (semi)professional level in Germany because of such programs as Signum, Stad, Calamus. I believe it never had that status in the rest of the world.

|> Then there are CyPress, some new program from Germany (don't remember the name
|> - sorry), etc.

CyPress was released by Shift some 3 or 4 years ago. It was one of the first word processors using GEM and GDOS extensively. Unfortunately Shift have closed, so there's no more development of CyPress.

: : SLIP emulators for the ST like TIA and Twinsock for Windows?

: Sure! Get atari.archive.umich.edu:atari/Network/MintNet/*.*

: -Steve
: selick@acs.bu.edu

I would like to make sure my quesiton was clear. I am talking about a psuado-SLIP. I have a shell account. I want a pair programs. One runs on the host which transfers any socket request it receives from my ST to a socket on the host. The other sends socket requests to the host program.

So, my ST will be using the host's IP address. I understand that Iwill not be able to run servers on my ST. I'm only interested in using the clients, especially ncftp.

Thanks,
Steven Whatley

>What about music and publishing.

Yeah, there are plenty of companies who print Calamus-documents in pro-
quality, several new products (eg. vector drawing packages) are
released (Eagle and Medusa will boost the developing) along with
excellent SL-modules. Steinberg is one of the biggest computer
music software/hardware producers (and they're located in Hamburg),
And if you look at the ad-section in STC, there's a good store in all
areas in Germany.

And if there are less shops around, they are sure more pro, and that
goes for magazines also (STC in very well produced and looks also
wonderful).

I thought that I was not totally wrong in saying that Germany has the
most virile Atari-scene. (thanks mr. Mylius!).

>It's getting better again. Recently Germany's Atari-users mailbombed a TV
>station to catch their attention. And it worked. They showed some Atari-stuff

Net is the best source of information - at least better that any brochures :-)

If there are incompatible progs, you'll find better soon (like Flash 1.6 ->
Connect 2.46, Word Writer 2.0 -> Papyrus, Sequencer One Plus -> Cubase), as
when you get the speed and the new TOS with new design you'll want programs
which use that power and some colours along with sound and OS capabilities.

About games: that's for someone else to tell.

> Also, is there a Falcon spec sheet floating around that I don't know about?
>I'd like to know what kind of grax, sound, etc. its capable of, as well as
>what add-ons are available. I'd be interested overall in hearing the gripes
>and praises of Falcon owners out there, espescially those who are musically
>inclined... Thanks...

I'd be brief and say this: if you get Cubase Audio, the sound capabilities
of Falcon are "sufficient", like they say in Mercedes-Benz specs :-)
You'll get quality up to DAT-rates (48Khz in 16-bit) and this in 8-16
simultaneous tracks with realtime manipulation.

If you get a graphic extension like Screenblaster and use SVGA, you'll
get resolutions like 960*640 62Hz in 16 colours or 800*560 60Hz 256 colours
or 438*480 with 1000*1200 virtual screen in true colour. It all depends how
you set up the software (I like more that 60 Hz rates, so that's why I don't
do bigger resolutions, even that 1280*960 is possible).
If you use RGB you'll get more in True Colour modes.

It does not replace GEM, it's a replacement desktop with
more functions, background images, better drag&drop, UNIX-
shell (Bourne Shell) etc.

It supports all screen modes, but they cannot be changed from inside
Gemini, and it cannot change them automatically.

Get it and try it - it's Shareware!
1.999 is the latest.

No, there are less than 625 visible. 768x576 (4:3) should be about right,
I reckon. Colour resolution is much lower than luminance resolution, too.

It usually costs a lot of money to chisel file formats out of people
like Word Perfect and Microsoft (eg try to get the Powerpoint file
format - it is NDA'd!) Things like RTF are freely available
'standards', so those get implemented instead.

If however someone does get hold of WP6 and Word 6 file formats, could
you post them here please?

Source record: 175099

Hi,

I'm helping a friend of mine getting some chess programs for her Atari
ST1040 but my first question is - does the Atari read IBM 3.5" disks?
If not how do I transfer any programs to her machine?

I'm not new to computers so feel free to suggest null-modem-cables and
other fun stuff but please tell me which program to run on the Atari!

Oh - and don't forget the chess program, either by code or by reference!

Thanks

Andrew

>>and SCSI-bus.
>
>
>The TT and Amiga does not work like that, the Custom chips on the latest
>Amiga's can only access the first 2 megs and its 4 megs on the TT....

Actually, the TT030's custom chips can access up to 10 megs of ST-RAM.

Most of the ST/TT custom chips have 24 address lines (for example, the
ST BLiTTER has 24 address lines) and hence can access up to 16 megs of
memory.

The reason that the ST BLiTTER is limited to 4 megs is because of the
memory controller. In the ST, the memory controller can only handle
up to 4 megs and in the TT030, it can handle up to 10 megs of ST-RAM
(TT-RAM is handled by another memory controller).

Hi.
As some of you may (or not) know, I'm trying to write a new QWK offline reader for the ST, featuring a nice GEM interface, among other things.
I'd like to try to make sure that the program is exactly what you want, and so It'd be really helpful if people could give me some ideas as to what they would like to see in a new QWK offline reader.
Information on the location of other Share/Freeware QWK readers would also be greatly appreciated (market research), as well as any comments you may have about aspects of these other programs you would like to see improved.

Overall, is it worth bringing out a QWK reader? Do people still use QWK OLRs out there? I know I used to, a couple of years ago, when I had a modem, but now that I've got University access, I've got no need for one. Do people on CIX / Demon have a facility to download mail in the form of QWK packets, and if they do, would CIX / Demon users rather use the provided OLRs, or a QWK program?

Also, what kind of GEM enhancements are best, and what is considered overboard in terms of GEM enhancements (by this, I mean popup menus, windowed dialogues, 3D buttons and the like)?

Any information is greatly appreciated. Either reply here, or to

bd@st-and.ac.uk

Thanks,

Brian

Decent memory configurations would be nice. The quy that decided that no one could possibly use more then 4 meg in an (Mega)ST(e) should be shot. How about 8 standard SIMM slots that can take up to 4 meg SIMMs (mix & match sizes should be possible) in banks of 2. For those that need (or want) more then 32 meg, a special slot for memmory expansion would be available. This should also please the third party hardware suppliers.

Seperate expandable vidio memory so there is no 'Well you have 16 meg, but you can only use 14 because 2 meg are used by the system.' crap.

14 MHz???

>a) .RSC file in German, working on English version, but would
> really like to get hold of the docs in English too.

They don't exist.

>c) The font in all dialogue boxes is too big and looks ugly.

Don't know what problem this is -- but then, I just use Gemini plain, and don't
have Geneva... Isn't the system font used in the dialogs?

>e) What are GBOOT001.APP and *.GIN files?

GBOOT00x boots Gemini, after a pause of x seconds. If you autoboot Gemini, it
can ahhepn that some ACCS don't get enough time to load. In that case you
don't autoboot Gemini, but GBOOT005 (for example) instead, to give all ACCs
5 seconds more time. GBOOT then boots Gemini for you.
The GIN files are the Gemini INfo files -- they store your settings. E.g.
USER\GIN\GEMINI.GIN is the default file for your desktop configuration --
i.e. the desktop.inf of Gemini. (Select 'Status sichern' in the Extras menu
to save the desktop. A dialog enables you to type in another name, so you can
save different settings. A double-click on a GIN file loads these settings
and thus gives you a new desktop... Oh, and the checkbox in the above dialog
is for turning ON the saving of background & windows (which you probably
normally want to be saved)).

>f) What does the 'Alles Aus?????...' option do in the menu?

You mean 'Alles Auswahlen'? That is 'Select All'.

>[Fenster = Window, Schlieben = Close, Abbruch = Cancel,
> uber = about, ... and that's about it really!]

Not bad, not bad... Keep practicing :-). How about 'Loschen'=Delete,
'Ausschneiden'=Cut, 'Kopieren'=Copy, 'Einfugen'=Paste...

Has anyone heard of the Medusa which is apparently a cobbling together by a third party (Swiss I think) of bits and pieces of the Atari? I think this might be the 'dream Atari' you're looking for. I came across a short article on it a while back in ST Format (or some such magazine) - if I can find it I'll post more details.

Give me a pop-down menu any day.

'An Apple a day certainly doesn't keep the doctor away'

- unfortunately, I have to work with the horrible things; it's like participating in a stockcar race on a bicycle.

I'm translating some source code from GFA Basic to another compiler. Could anyone please tell me (preferably using "standard" TOS terminaology, e.g., evnt_multi and so forth) what the following GFA BIOS and XBIOS calls actually do? I have comments on some of them, but it's not clear to me how, for example, XBIOS(29,1) turns on the floppy drive light. Does it POKE to a GI register, or what?

Thanks in advance!

```
~XBIOS(6,L:VARPTR(colors$)) ! set palette colours
iorec%=XBIOS(14,0) ! iorec input table
~XBIOS(29,15)
~XBIOS(29,NOT 16)
~XBIOS(30,16)
VOID XBIOS(6,L:V:pal$) ! restore beginning palette
init.pal$=init.pal$+MKI$(XBIOS(7,i|,-1)) ! save beginning palette
~XBIOS(21,1,-1) ! turn cursor on
~XBIOS(21,0,-1) ! shut cursor off
IF XBIOS(4)=1 ! Medium Res test
~XBIOS(15,x%,y%,-1,-1,-1,-1)
~XBIOS(29,1) ! turn floppy light A on
~XBIOS(30,6) ! turn floppy light A off

BIOS(1,1)
BIOS(1,2)
BIOS(8,1)
~BIOS(3,1,code|)
~BIOS(3,2,code|)
key|=BIOS(2,1) ! accept from rs232 if present
key$=BIN$(BIOS(10)) B
```

It loads 123 but saves as ldw. there is a conversion program that comes
with it to go back to 123 but it doesn't always seem to write a valid file.
The macros/formulae are fully 123v2 compat so if these functions are in
123r2, tey will be in LDW.

> 1040STe w/4 Megs.

Well, I'll make a note of your address, but at the moment CLAv3
only runs in colour at a minimum 800*600 res. It will work in
ST-High eventually as do all previous versions, but v3 was a
re-write from scratch so I'll be doing the mono support once the
rest is up & running mostly.

> Also, where can I register for this program and how much
> in US Dollars would this cost?

I don't accept dollars :)

No, seriously, we usually ask for an international money order
for pounds sterling (UK currency) - value 40 pounds for a USA
registration (slightly more expensive than EEC as shipping
costs more).
I don't know what the sterling/dollar exchange rate is at the moment
so I cann't tell you the $ cost.

> The last Circuit Simulation Program I've
> used was Circuit Maker II from Iliad Software, which is pretty old and
> unsupported at this point.
> Is this program comparable, or (hopefully)
> better? Thanks.......

Having never come accross Circuit Maker, I cann't comment.
I tend to aim for being comparable with the likes of the
Intergraph Ace+ system on the Sun (cost $30,000 per year),
but cheaper.

Why not take a look at the demo of CLAv2r3a which I put on ftp.uni-kl.de and micros.hensa.ac.uk today ? The missing bits from the demo are the VHDL compiler & FSM editor, both of which are into new versions as well (but no demo versions are compiled for them). The main schematic editor / simulator has SAVE disabled, but nothing else is missing - all entry, simulation & printing functions work.

If you like it, registration details are included with the demo.

Craig.

You mentioned TIA. If I understand you correctly, you want your ST to
talk to TIA on a remote host over a phone line. If this is the case,
assuming TIA is already installed on the remote host, this shouldn't
be a problem. Failing that, if your Provider allows it, you can ftp
TIA and register it for your own use. TIA isn't restricted to users of
PC based SLIP software; it's a generic SLIP emulator which _should_
work with all implementations of SLIP, including MiNTnet's.

I've had no problems using MiNTnet to connect to TIA, other than those
caused by bugs in TIA :) The only down side with using MiNTnet is the
setting up required. In addition to MiNT and MiNTnet, you'll need the
MiNTOS package and plenty of patience.

You can get more information about TIA by sending a blank email to:

tia-info@marketplace.com

Alternatively, point your web browser at:

http://marketplace.com/tia/tiahome.html

I should point out that I have no affiliation with the authors of TIA
or with Marketplace, I'm just singing the praises of a great product.

Cheers, Steve

Given that we are talking about a minimum of 32 address lines and us poor folk
are unlikely to have a fully populated 4G memory space - just arrange for the top
address line to act as a bank select with upto 2G in each bank or use more if you
prefer an asymmetric split or to select ROM et al. Just make sure you don't pick
lines in the middle like the PC 640k/1M limit or the ST 4M limit ... and ensure all
address lines are available.

IR>What would you want in it???

IR>First of all... _No_ 2 1/2" internal drive as these don't give as much room
IR>or speed as 3 1/2" ones.

First of all, let's put it in a nice tower or desktop case so there's
room to add more devices, such as CD-ROM and streaming tape.

IR>I think we should have _pull down_ menus as those "crash-down" ones are
IR>somewhat annoying (doesn't everyone agree???)

Make it software-selectable and store the preference in NVRAM - make
everyone happy.

IR>An '040 or '060 as '030s are just too old. And at least 50 Mhz ???

'040/50 is good. Make an '060 optional.

IR>1.44 internal drive, and HDD as standard (say 540M or so?)

If it's in the tower/desktop case, using the Teac combo drive would be
easy, too. HDD interface should be IDE _and_ SCSI-2 (Fast SCSI would be
very nice also).

IR>A _separate_ keyboard - with keys that don't feel like a sponge (like my
IR>1040STfm)

Both the Mega and MSTe keyboards are fine - but we could add a
DEKA-style jack as long as we're at it and let the user stick a clone
keyboard on there if desired. F11 then = HELP and F12 = UNDO.

IR>Multi-tasking doesn't seem to be too way out these days

Already done, just choose which one is bundled.

IR>and it would be nice
IR>if we could get rid of the 8+3 filenaming convention - lets have longer
IR>filenames - and perhaps add a bit to remain compatible with previous disks..

Use MINIX if you want to dump 8+3, but leave the original in place for
standardization.

IR>PS. (For Roger Sheppard) This is just a bunch of ideas, so please
IR>don't go decrying a really nice idea ok?

Hear, hear!

I have seen enough messages on the nets and on GEnie to give serious consideration to the thought that Atari had absolutely no desire to setup a dealer in NZ. Similarily, after Atari Canada was closed down, it was VERY difficult for dealers to get product or parts, or re-imbursement for warranty work. Obviously, the situation in Europe is otherwise: mind you, all the 'cracks' I have seen originated in Europe or UK.
All IMHO, where applicable........

n> When you put a Blitter *in*, you have to *remove* 2 soldered pins on the
n> PCB. I dunno where these are, though
n>
A little off the topic, BUT, considering what a BLiTTER does, what
happens when its not there? Specifically, I thought my MSTe had died,
and while we were checking it with the diagnostic cartridge, the results
showed an OK blitter, BUT there is no chip OR socket present! I guess I
should run GEMbench with blitter on & off, but useful comments would be
appreciated.

I had several emails, and to head off any more, my MSTe had an AJAX
die (strange - I guess it doesn't like running at 8 mhz - never had a HD)
and the TOS sockets were dirty [even after trying 3 sets of chips]. Some
people have a real skill at getting things to work. I had swapped out the
FDD and TOS chips myself before taking it to a friend to have a looksee, and
it didnt do any good :(!! I have a dead mb [no video or output from the
RS232-makes a diagnostic cart useless :(- any suggestions where to look?]
(it has a blitter) of a different revision (older) that we swapped all the
socketed chips out of/with the (now) good mste mb, and all these work .

I have no intention of selling any dead mb I have. They get donated to
my local user group, and will, hopefully, be put to use helping another
member's cpu to revive.

4870. Calling .ACCs without a menu bar

Newsgroup: comp.sys.atari.st
Date: 1994-12-07 21:40:26 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <ELIKDCUSUp@stingray.manawatu.gen.nz>
Source record: 175176
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Is it possible to call an ACCessory without having to have a menu bar and everything set up first?

I have my own menus (which I will release when finished) and want to be able to show the .ACCs loaded - also how do I do that??? - and let the user select them.

Is this possible?

Any help would be most appreciated,
Richard.

PS. Could someone tell me when the new comp.sys.atari.programmer group is up and running please? (Unless ofcourse, the mediator posts something to that effect).

Source record: 175184

(I recently wrote the following):
>
>>* I'm surprised that there's any market at all for ST magazines, since as
>> far as I'm aware, Atari Corp. doesn't even manufacture personal computers
>> any more (although I have heard rumors of possible clones.)

(to which someone replied):

>Apart from the fact that Atari do manufacture machines (they're just not
>designing new ones), why would a lack of manufacture mean that existing
>machines become unused overnight?

(to which I reply: If Atari is still manufacturing computers, I stand
corrected. The last I had heard, and this included an interview with Sam
Trameil about a year ago in the San Jose Mercury News, Atari was OUT of the
personal computer business. Period. I had also heard that their recent
annual report to stockholders said the same thing. This is definitely not
"wishful thinking" on my part, because I own an Atari, and I'd love to see
some support from Atari Corp. The SJ Merc article I read with my own eyes.
The annual report to stock holder thing is hearsay. And I do still use
my Atari computer. I also wrote the following:)

How can you have less than zero coverage? That's mathematically impossible
.> Atari machines haven't appeared in any computer publications that I've
>> seen in years.

(to which someone replied:)

>PCW, the biggest UK mag (I believe) often features short reviews of Atari
>stuff. The current issue reviews Janus. Recent issues have reviewed
>music stuff for the Atari Falcon.
>
(to which I reply: I said computer magazines I'VE seen, and admittedly,
that's here in Silicon Valley, U.S.A. not Europe or U.K. Here, there really
are only two platforms left - PC and Macintosh. It's getting to the point
that you can buy software and accessories at your corner grocery store for
either of those two platforms. Newspapers are full of ads for software and
accessories for PCs and Macs. If you say you have an Atari Computer, and
are looking for software or accessories, you will likely get a blank stare.
As for coverage of Atari computers - None, Nada, Nichts, Nein, Zippo. I
also wrote:)

>> It's called the free market system.

(To which somone replied:)

>Thanks for your useful contribution. Not.
>David Stevenson Email: djs@jet.uk or hoagy@cix.compulink.co.uk
>- Disclaimer: Please note that the above is a personal view and should not
> be construed as an official comment from the JET project.

(To which I reply: The reason I mentioned that is because I believe in the idea of a free market and a free press. The original poster of this thread seemed to whine about the fact that only one magazine would monopolize the Atari market. Maybe I misunderstood, but it seemed to me that the original writer was suggesting that something ought to be done about it. But what? Government intervention? YECCHHHH!!!! If you don't like their magazine, don't buy it. If you can put out a better one, do it. Hopefully, there's a big enough market out there, especially in Europe and U.K., to keep Atari computers and clones alive, and enough interest to justify the existence of several magazines. I think the interest in the U.S. for Atari computers has pretty much died out, but then, that shouldn't be a great revelation to anyone. OK, flamers, Flame away. ---Mark van Wyk)

scvicato@unidhp.uni-c.dk (Scanview Software) writes:

>I'm helping a friend of mine getting some chess programs for her Atari
>ST1040 but my first question is - does the Atari read IBM 3.5" disks?

Yes, although some TOS versions have problems writing a genuine DOS format disk
so to be sure, always format on the PC.

>Oh - and don't forget the chess program, either by code or by reference!

Well, as I see it there are only two commercial chess programs that play really
strong chess and they are Psion Chess and Chess Champion 2175.

There are also some public domain chess programs out on the net that you may
want to look at, esp GNU Chess.

>To do d2d you MUST ofcourse have a large *SCSI* drive in addition. True.
>IDE drives cannot do DMA, and so is useless for d2d.

?????? DAME & Cubase Audio both demand a SCSI HD, but that doesn't mean
you cann't use an IDE drive for D2D - WinRec records quite happily on even
my slow hard drive, as do several other comercial programs.
DMA isn't really the important thing, sustainable data rate is what is
important - the internal IDE interface is quite capable of keeping up with
4 track record/playback. You only need the SCSI drive if you are going
for more simultaneous tracks, which is why C.A.F. only supports SCSI.

>16-track audio *IS* possible with the base Falcon hardware. However,
>you can only *record* 1 stereo track at the time. With additional
>hardware DA's you can record upto 8 tracks at the time.

No, strictly speaking it isn't - you require a SCSI HD to get 16 track
audio, which doesn't come as standard with any falcon.

>Get your facts straight. The Falcon comes *with* a SCSI2 port. No acsi
>in sight. All you need is the scsi drive.

True, but wouldn't you have preffered to be able to stick a SCSI drive
inside the case? I never understood why the f030 came in the case it
did, when they already had a nice pro case in the TT/MegaSTE box.

Craig.
f030 32Mhz, MiNT1.12, net-055, X11R5
- but not blind to the defects.

>
>

As soon as you decide to use a policy like that, you've crippled your architecture (just like a PC).

Sure, design your hardware like that if you want, but don't tell people that that's what you did - don't give them a memory map which say's "Fast Ram will always be here", 'coz one day you'll want more & then you'll find that you just cann't add it without kludging. I'm talking software compatibility 0- I'm not suggesting that a Falcon could have 2G of memory, but a program developed on one may well outlast the machine (Unix started life on a PDP-11).

So, design you're hardware like that, sure - but lay down the law that the user must request Fast Ram and use the address they're given just like TT-Ram is allocated now, and let the OS handle where in the hardware memory map the RAM actually is.

BTW - does the processor direct slot on a Falcon give all 32 data lines? If it does, then it would be piss to knock up a Fast Ram board for it.

Craig.

A few corrections: If you stick with pixel fonts (GEM's FNT and Signum!2
format) a hard disk is not really necessary. A lot of our customers
don't have one.
Papyrus is actually quite fast even on 8 MHz machines by using an
internal Speedo cache that makes vector font drawing as fast as bitmap
fonts.

From: millert@grad.csee.usf.edu
Message-ID: <3c5lfh$9ta@mother.usf.edu>
Source record: 175189

Even MIPS ratings for Morotola and Intel processors would be meaningless because 1 MIPS on one CPU may be a lot less than 1 MIPS on another.

For example, 1 MIPS on a PPC would be much slower than 1 MIPS on a 68000, although on a PPC, with the design philosophy behind RISC, you'd never run it that slow.

1 MIPS on a 486, also, would be noticably slower than 1 MIPS on a 68040, because, for one thing, the 68040 instructions tend to do more, and secondly the 68040 instruction set is much better organized than the 486 kludgy piecemeal crap instruction set, so it's easier to write good efficient assembly and easier to write a compiler to take good advantage of the instruction set.

In reality, even the 386 is NOT a slow processor. The problem is that most companies, expecially Microsoft, don't want to put in the time to develop a compiler that is capable of properly optimizing for the instruction set. It's not easy at all to develop a good compiler for Intel processors. It's no picnic for 680x0 either, but it's MUCH better.

The easiest kind of processor to develop a compiler for is a RISC processor because there aren't any weird nuances to a very complicated instruction set. Instead, there are only primitives. Too bad that even that is beyond the intelligence of Microsoft programmers.

4883. Re: Wordprocessors without bugs?

I think the original poster of this message only had a 1040ST and wanted
a simple but robust wordprocessor.

I'd reccommend Marcel 2.x which is shareware and worth the $10 registration
fee. It's not exactly bugless (and the spellchecker in v.2.2 stinks) but
generally it works well and supports Dot Matrix printers pretty
extensively. It can be found on good Atari ftp sites like tu.clausthal.de
and I'm sure others as well.

He could also checkout the archaic but venerable ST-Writer Elite. It
is relatively bug free, functional, fast, and it will run fine on a
floppy based 1040.

Hope this helps.

Ari

]
] Have you checked for James Bond with a B?

James Bond is a terrible game (any of them), James Pond is the one where
the main character is a fish.

James Pond II - Codename: Robocod is a much better game, and being
released later, should in theory, be somewhat easier to find.
(Usually referred to as just "Robocod")

I'm interested in obtaining one of these hard-ware accelerator cards for my TOS 1.62(UK) STe with 2.5meg RAM. I'd be interested in any information I could get on it. I know that a company was/is selling them for around $100 but as well as further information on that, I'd also like to know various other bits 'n' pieces, such as, how hard is it to install (i.e. does it just "plug-in" or would I have to get someone with some decent soldering/electrical equipment to do it?), how compatible is it, (if it's completely turned off, is my system still 100% compatible with whatever it worked with non-enhanced?

How fiddly is it to use? Will X-Control recognise it, or do I need a special program to toggle speed & then reset the machine etc.

Is it possible to throw a 16Mhz 68030 chip into it to be able to run 68030 optimised code?

How tricky is it to get an FPU chip to plug into its FPU socket?

Does it have any caching?

I'm getting sick of the speed of this machine for a lot of functions,(screen redrawing in complex applications, archiving etc.) and this looks like an affordable solution...

Are the distributers available on the net?

Yes Atari machines will read IBM 3.5" disks, as long as they are 720K, not 1.44 meg floppies. Download what you want to your IBM, put it on a floppy, and pop the floppy in the Atari's drive... then do what you will! :-)

The screens are supposed to be on 256 byte boundaries - not 4 byte (otherwise
malloc would be fine as you said b4). Perhaps this changed in the STe???
But on my 1040STfm it would crap out (unless your malloc command is only using
memory that starts on a 256 byte boundary - would seem odd though).

Richard.

Well, the DEKA AFAIK is an external solution for an external keyboard.
I just installed a wonderful product called ATKEY, which I purchased
from System Solutions in UK. This is a board which goes inside the
case (I think you need a bigger case. I use an IBM box that I picked
up real cheap at a surplus warehouse). Anyway, this lets you use any
one of a number of IBM AT keyboards. It really does make a difference.

As far as upgrades go, I received a E-Mail from Stephan Skrodzki, author
(one of them) of the VOFA 4000 board which allows an IBM VGA graphics
(Sorry, make that SVGA) card in the ST. He said that they are currently,
out of the 4000 model (You could still DIY, there are full docs avail),
but the good news is that he plans the release of VOFA 4010 within
the next two months. This new board will allow SVGA true color boards
to be use even with PAK3 and also will provide for Ethernet capability]
on our beloved ST. Sounds promising.

Take care,
Jeff

Has anyone bought and used D2D's full version, or anything comparable (in the same general price range). I'm looking for something a *little* more than the demo version of D2D for multitrack guitar work. Maybe just guitar, drum machine, and bass. Price range about $2-300 preferably. I've managed to get some fairly good results on the demo D2D as long as I don't overdub more than 3 separate tracks, so even a 2-track package may be OK.

Thanks,
Russ

Mark, the medusa has been selling now for a few months in the U.S.A. and
in Germany (I believe it's also available in the U.K. now).

It is currently most definately the fastest atari around (and it has the
'060 prototype finished as well), however the price isn't cheap, it will
cost around 3,400 U$D for an 8Meg 450 HD Medusa System with tower, HDD and
all that sort of stuff.

Cheers

I use the AdSpeed for my ST, so I can share some of my experiences. I
think most of this is relevant for the AdSpeed STe. First, I had to
remove the 68000 chip. This required de-soldering as the chip was
not socketed. (Check your machine, but I think The are all soldered
in). After this, I had to solder a socket where the 68000 was and then
insert the AdSpeed board. It can be tricky if you are new to soldering.
Compatibilty is 100% (besides games) AFAIK. You can swith 8 and 16
modes with the provided CPX or you can install a switch. The board
came with the terminal for this. The STe version has a socket for
a FPU, but I can't say I have direct knowledge of this. You can
switch on the fly with no problem. I use 16 Mhz with Overscan with
no problem. The address for ICD, the manufacturers, is:

ICD Incorporated
1220 Rock Street
Rockford, IL 61101
USA

ICD Europe GmbH
Am Goldberg 9
6056 Heusenstamm
Germany

This is true, but by using the dip-switches you'll find that the internal
doesn't get recognised at all when switched to anything other than ID 0.

If anyone *has* got this to work I'd be delighted to find out how as it
drove me completely insane when I tried it. I've used AHDI, ICD (PD only)
and HDDriver boot software.

> BTW, I think that modern SCSI-driver software can set auto-boot from
> any drive in the chain, removing the need to remap the internal unit.

From my attempts I also tried to boot from the external drive's first
partition (set as E:\ ) but found that accessories still tried to boot
from C:\. I never got around to trying software to divert to another
partition.

It's really infuriating when my external is 19ms access and 700+k/s and
the crappy Seagate trundles at 30ms 350k/s

But with everything in the OS you are nearly forced to use their "wheels" which for sake of "standardness" are usually the worst quality. With code-sharing and such, this really isn't a problem, and you aren't bogged down with MPEG support built-in when you don't need it, making for a faster, smaller OS.

4904. Re: Should I buy a Falcon?

Newsgroup: comp.sys.atari.st
Date: 1994-12-08 06:55:43 UTC
From: FELDAK79@SNYONEVA.CC.ONEONTA.EDU
Message-ID: <01HKDT5IMN2Q90OIHM@SNYONEVA.CC.ONEONTA.EDU>
Source record: 175197

I used to own one and I too inherited alot of older ST software when I upgraded...

yes, Flash 1.6 will definately work on the Falcon - except the capture buffer window suffers redraw problems (due to different window object sizes in the new AES) in ST medium rez (640x200) mode.

Wordwriter 2.0 will work fine and runs at a faster clip - especially when it access the disk!

Audio: I can't speak for it because its not my thing...there' alot of native Falcon audio stuff anyway...

CrackArt - will work fine except the block rotation function will cause a major crash!

Deluxe Paint works fine as well as does DEGAS.

COntrary to popular belief, the Falcon is surprisingly compatible w/older software. Usually, the only stuff that won't work are very old applicatons that were poorly written and/or games that are copy-protected or rely on assorted and illegal hardware tricks.

You can find a list of verified compatible games and applications compiled by Heiko Hartmann on various Atari ftp sites under the Falcon directory.

There's also a great program called Backwards that allows you to configure the Falcon to work with certain ST programs and games. It increases Falcon compatibility substantially!

Almost all languages will work - except for STOS (I think) - it needs a patch. HiSoft anf GFA Basic both work fine.

Now, as for getting a Falcon...(I'm gonna get flammed)...you have to weigh the costs to justify it. If you have a major investment in your Atari software and plan to stay with the platform then its worth the price.

However, if you are looking for the dream computer - you won't find it in the Falcon - its essentially a super STe. The audio capabilties are impressive and the new gfx modes are nice but the machine is vastly underpowered for the screen modes its supports.

Software support for the Falcon is increasing (alittle) but its still VERY weak in certain areas - namely games and low to mid-range graphics apps.

Not everyone needs to work in 24bit or 16bit color! I needed to be able to do sprite and background gfx in VGA modes with good software.

Unfortunately, that software wasn't around when I needed it so I'm typing this from my PC clone which does have it.

Also, the long promised 486 PC emulator has yet (ever?) to arrive so forget serious PC emulation. Also, the Spectre GCR ins't compatible either.

Last but not least - most of your disk copiers won't work with the Falcon because of the CPU timing differences.

In the end, you must weigh the costs/performance of the Falcon with what you need and want to do. If you need audio - buy a bird. If you want to paly games - keep your ST or buy a PC. It's up to you.

The falcon was never cheap and probably never worth the money but its not a bad computer deep down.

Good luck w/your decision. Hope this helps you out.

Regards,

Ari

There were two different Stacy memory boards. The board sold as the
2MB version had sockets for two low-profile SIPPs in addition to 2MB
of ZIPPs. The 4MB board was a different layout and included 4MB of ZIPPs.

Yes, the documents say that you get a much better throughput when using
an external protocol, especially with xyz. (I found this to be true as
well, but only if you ARE NOT running MINT.)

: >It is working on my 1040 STe without worrying about either of these
: >issues, but I would like to know that I am not ignoring anything which
: >may cause problems with other systems and TOS versions.

I should work on all TOS 1.x and 2.x versions. I'm not sure about 3.x and 4.x,
but I think it will work.

: The screens are supposed to be on 256 byte boundaries - not 4 byte (otherwise
: malloc would be fine as you said b4). Perhaps this changed in the STe???

The STe video shifter can handle all adresses, as long as they're even.

: But on my 1040STfm it would crap out (unless your malloc command is only using
: memory that starts on a 256 byte boundary - would seem odd though).

Just put something like

Real_screen = Screen_base && $ffffff00;

or so. Forgive me, it's a long time ago I programmed C.

I have vague memories of an Atari transputer-based workstation being announced a good few years ago... did such a beast ever exist, or is my mind fogged by too much 6X over the years??

If such machines existed, can anyone tell me anyhting about them? And would they like to flog me one :-)

Drop me a line at al@cheetah.inmos.co.uk, I'll post a summary if anyone's interested.

Cheers,
Al.

I'm not going to say that designing a dead dead good machine from off the shelf isn't do-able, but it IS going to be massive, and still not as good as using at least some custom/semi-custom logic.

Using FPGA technology is a good compromise between custom ASIC's like atari tend to use, and off-the shelf components.....

When you start COMA for the first time it use English messages per dafault.
You can use the button 'Deutsche Meldungen` to use German instead.

Dunno about the doc's, though.

Steve Wells (wells_s@kosmos.wcc.govt.nz) wrote:
: I'm interested in obtaining one of these hard-ware accelerator cards
: for my TOS 1.62(UK) STe with 2.5meg RAM. I'd be interested in any
: information I could get on it. I know that a company was/is selling
: them for around $100 but as well as further information on that, I'd
: also like to know various other bits 'n' pieces, such as, how hard
: is it to install (i.e. does it just "plug-in" or would I have to get
: someone with some decent soldering/electrical equipment to do it?),
: how compatible is it, (if it's completely turned off, is my system still
: 100% compatible with whatever it worked with non-enhanced?

The STe version is super easy to install - it's getting the old chip out
that's a bit nerve racking. Just be gentle with it. The new board plugs right
in the old processor slot.

I have found very few times I needed to switch back to 8 mhz. Even PCDitto I
seems to work at 16mhz! I installed a hardware switch, and can shift on the
fly.

: How fiddly is it to use? Will X-Control recognise it, or do I need
: a special program to toggle speed & then reset the machine etc.

They have a da, maybe a cpx, I don't remember. But with a hardware switch, you
don't need either.

: Is it possible to throw a 16Mhz 68030 chip into it to be able to run
: 68030 optimised code?

Not without making your own board :)

: How tricky is it to get an FPU chip to plug into its FPU socket?

Finding the chip isn't hard - use a 16mhz (or faster) 68881 chip. Get a 16mhz
(or faster) crystal and solder it in. It's really easy. Unfortunately, I have
not been able to confirm its functionality - the SYSINFO program from STfax
says I have no fpu. I don't have any programs to try it with though.
: Does it have any caching?

: I'm getting sick of the speed of this machine for a lot of functions,(
: screen redrawing in complex applications, archiving etc.) and this looks
: like an affordable solution...

: Are the distributers available on the net?
If they still sell it new, you could talk to the owner of ICD. The address is:
ICDINC@genie.geis.com

Hope that all helps! I just installed mine last month by the way.

-Steve

No kidding. That's why I want (VERY DESPERATELY!) to run my UUCP under
MiNT on a minix filesystem... All that disk access is horrible under
TOS.

>Actually, DOOM runs under Linux! (hehe... had to point that out)

I know, I've got it! :-) Can't get X up on my system at work though,
ConfigXF86 just barfs (and it's a simple generic-SVGA + VESA monitor
job, too).

>>>4) a better mathematical machine.
>
>Hehe... provided you don't want to do DIVISION on a PENTIUM!

Done much raytracing on your new machine? :-) Somebody posted which of
the POV-Ray sample scenes (down under the math directory) you can trace
on a Pentium to show how the bug can _really_ affect something as
"simple" as rendering... the FDIV bug mangled something like 1% of the
pixels, which is pretty bad, even though it sounds minor.

Actually, it _is_ a bright idea... nobody said the tiny, fast "hard
drive" had to be a physical disk. Flash RAM or something.

>Now how about this: Design extremely high-density, low-cost DRAM that has
>a very slow access time - say, on the order of 500 ns. Use it for swap
>space. I don't know how low-cost you could get it, though - it might
>still be an impractical amount of money for a reasonably large swap space.

Who knows. The big problem would probably be making it a SCSI device...
Then again, with Flash RAM, you could format it and everything... to
brain-dead OSs that attempt low-level crap, you could even act like a
real disk (partitions and everything).

>IDE is fine. It is slightly faster than SCSI for most low-end purposes -
>no SCSI command and bus arbitration overhead (which add a few milliseconds
>to the average access time), and the raw bus performance is roughly the
>same. (Both well exceed the performance capabilities of most drives under
>1 GB.) And given the number of compatability problems that many SCSI
>implementations have on the PC, it's easier to use IDE.

Now, throw in multitasking and multiple devices. Oh, sorry, normal IDE
can't handle more than two devices... SCSI does DMA, and IDE requires
the CPU to push all the bits across the bus... painful on an ISA system.

>Most people don't get a CD-ROM with its own card. They get a sound card
>that has a SoundBlaster type CD interface, and then buy a CD-ROM with that
>same interface. (Or more likely they buy it all as a big "multimedia"
>bundle.) Also, most tape backups sold are those of the type that use the
>floppy controller instead of a tape controller - slow but really cheap, no
>extra interface card required.

That's not what I've seen. *Everyone* I know that has a PC with a
CD-ROM has the CD connected to either SCSI (the smart ones) or its own

interface card. They all bought the cheaper SoundBlaster that doesn't have the SCSI or IDE interface on it. I only know one person with a tape drive on his PC; most PC owners don't seem to backup their data at all.

>Good thing you put in the smiley. Most PC owners don't like SCSI because >it is not low-cost. A decent PC host adapter costs you $100 or more.

Gee, that's certainly expensive! Sheesh. But they'll pay $700 every year to upgrade their CPU.

>SCSI CD-ROM drives are far more expensive than SoundBlaster or proprietary >card interface drives (we're talking under $150 for double-speed SB >interface drives). SCSI tape backups cost. In the IBM PC world, SCSI is >not a cost-effective option for most users, and it's an option associated >with incompatability problems. (For the longest time, PC SCSI >implementations have not been that great.)

That's what you get when you use the lowest-common-denominator for everything. It took a LONG time before they realised SCSI was a standard that had to be implemented properly, not half-assed like all the other PC "standards".

>Now don't get me wrong. I'm of the firm opinion that 100% SCSI would be a >good thing. It doesn't really cost any more to implement than IDE - the >sole reason that IDE is cheaper is higher volume sales.

It'd be nice if more motherboards had SCSI on the motherboard...

>I like slots. I wish my computer had more of them, but Apple really reams >you pricewise for getting very many slots. SCSI/IDE are OK for certain >applications, but many need card interfaces.

IMHO IDE is fine for DOS. As soon as you start multitasking (especailly if you're on a system with virtual memory) IDE becomes a HUGE, HUGE loss.

>of sense.

Oh, and I guess your new DOS 6.22 is '486-optimised? All of your DOS and
Windows apps require a '486 or better? Yah, right. I'll bet 95% of
your DOS apps run fine on an 8088 (drag out those old XTs!) and *all* of
your Windows apps run fine on a '286.

I know all the DOS apps I run at work are 8088, and all the Windows apps
(including FrameMaker 4 and CorelDraw 3) would run on a '286. At least
I'm running Os/2 to get _some_ use out of the Protected Mode of the
'486...

You seem to think that Atari users have absolutely no experience with
other, more modern systems.

Source record: 175134

Makes you wonder what gems will be in the final issue of ST Review next month... Apparently there are all sorts of ST Format stories that could be told if Vic is feeling annoyed enough!

It seems a shame that STR is going down now, since there won't be any other publishers (of a decent size) who will be willing to take on an Atari-specific mag. What will all the wonderful STR writers do? Work on Mac and PC mags? It would be a terrible shame!

TSR _used_ to produce games. Then the marketing division took over, and
now all they do is produce marketable "things". It was pretty gross,
and seemed to start around the time the Dragonlance modules first came
out.

We were already totally disenchanted with AD&D by then, and had moved on
to Rolemaster and Palladium games.

Thanks Simon!

BTW folks, my port of GNU make 3.71 is basically a MiNT-only thing...
chances of it working under TOS are pretty slim, and you might even need
a Minix filesystem.

I can recommend the game based on the awesome original Amiga version.
Pretty much the _best_ piece of coding seen on the ECS Amigas and a very
playable (if a tad difficult) game too. I intend to get the AGA Super Stardust
when I can afford to.

>Of course there are no `other tasks' under DOS, TOS, or MiNT. ("yet" on MiNT).
>Linux, on the other hand... ... ... okay, okay, I'll go away!

Before anyone jumps on Warwick and says "MiNT runs other tasks!", I
suspect he meant that there's no way for multiple tasks to be doing disk
I/O at the same time under MiNT. We don't have decent multitasking ACSI
drivers yet for MiNT, so we're stuck with lame disk access, still
(though it is better than IDE, since we can do DMA).

>(Don't worry, I'll still be generating GEM NetHack)

Hey, what about GEM++ 2.0?!? You can't not release it after you did all
that work on the documentation...

Harry, leave the internal _drive_ set to SCSI ID#0 - just change the DIP
switches. Set your external to ID#0 and it will be Drive C:, and the
internal will be D: (or whatever). I've done it, it works.

Well, since it's now been a few years since I got rid of my ST, it's
probably time to get rid of the books, programs, etc. that I kept in case
I ever got another one ... If there's no manual listed, it's because I
couldn't find it after a hurricane and two moves 8^).
Here's the list:

Books -
original asking
Compute's Atari ST Volume 1: VDI $19.95 $10
Volume 2: AES $19.95 $10
Volume 3: TOS $24.95 $12
Abacus Atari ST Peeks & Pokes ..... $16.95 $ 8
Tricks & Tips $19.95 $10
Graphics & Sound $19.95 $10
Sybex Programmer's Guide to GEM $19.95 $10
Atari ST Basic Sourcebook (large format) offer
Atari ST Basic Sourcebook & Tutorial (small format) offer
Atart ST Owner's manual (dunno why I still have _this_ ...) offer

Mapping the Atari (8-bit) ..... $14.95 $ 7

Software -

Personal Pascal v2.? disks & manual ...? offer
Tackle Box ST & TB News 1&2 disks & lg. binder manual ...? offer
FunctionZ function key labeling (disk only) ...? offer
PageStream 1.8 (disks only) ...? offer

Misc -
DeskCart (probably needs new battery), disk & manual ...? offer

>them for around $100 but as well as further information on that, I'd

You can give ICD an email on genie, and maybe they could tell you
their current price (their genie ID is "icdinc").

>also like to know various other bits 'n' pieces, such as, how hard
>is it to install (i.e. does it just "plug-in" or would I have to get
>someone with some decent soldering/electrical equipment to do it?),

It's pretty simple to install since the STe's 68000 is socketed.
Just find a chip puller or two thin, stiff wires to pull out
the original 68000 with.

>how compatible is it, (if it's completely turned off, is my system still
>100% compatible with whatever it worked with non-enhanced?
>

I've yet to see a program not run on it that did run on it before.
You may want to install an external switch to switch to 8 MHz while
loading up certain copy protected games, then switch to 16 MHz once
the game is loaded. Some really fun games at 16 MHz include Sky Chase
and Steel Empire.

>How fiddly is it to use? Will X-Control recognise it, or do I need
>a special program to toggle speed & then reset the machine etc.

They include a X-Control panel module, a special program, and an
accessory that you can switch the processor speed with. You can
switch speed on the fly. You can also install an external switch to
switch speeds when you don't have access to one of the above methods.

>
>Is it possible to throw a 16Mhz 68030 chip into it to be able to run
>68030 optimised code?
>

I doubt it.

>How tricky is it to get an FPU chip to plug into its FPU socket?
>

You need an FPU and a crystal. If you're not comfortable soldering,
don't do it.

>Does it have any caching?
>

Yes.

>I'm getting sick of the speed of this machine for a lot of functions,(
>screen redrawing in complex applications, archiving etc.) and this looks
>like an affordable solution...
>

It works great and I'd hate to go back.

Source record: 175009

```
] : I'm having this strange problem that I haven't had before. I'll be
] : working in my editor or my communication program and all of a sudden
] : as I type, the characters on the screen go slower and slower, until the
] : reaction from keypress to seeing it on the screen takes several seconds,
] : then the machine freezes completely. It's not just the typing, but all
] : aspects of the machine, like saving a file, getting the file selector and
] : pressing "buttons" with the mouse takes just as long.

There are AFAIK 2 viruses (virii?) that will cause this. They generate
a processor delay that gradually gets larger, and henceforth, makes
the machine slower. The PD program "V-Killer" v3.84 by George Woodside
should recognise them, as should Sagrotan (the decent version of which
is in German, there is an english version of an older release).
Or, you could try & buy UVK (Current version is about 6.2 I think),
or Antidote (Shareware, amazingly fast) both handle link-virus
detection, but the virus in question should only be in a boot-sector
form. All of them, other than UVK should in in ./atari/Utilities
at atari.archive.umich.edu (There may even be a dedicated Viruskiller
directory in there now!).

WELLS_S@IX.WCC.GOVT.NZ I am in no way affiliated with the Government
Steve Wells. or City Council.

4948. To the author of rainbow (or anyone else who knows)!

Newsgroup: comp.sys.atari.st
Date: 1994-12-08 18:46:57 UTC
From: stuart@cs.ualberta.ca
Message-ID: <3c7kb1$jb@scapa.cs.ualberta.ca>
Source record: 175015

How much is rainbow going to cost me to register and/or buy for either
the current demo version, or for rainbow II?

There are some prices quoted in the credits, but they are mostly for
europe- there are no american or canadian distributors, so I am having
a hard time estimating what it would cost me in canadian dollars!

Rainbow looks like a sure-fire winner though. Great art package. I'm still
used to having different shaped brushes like in degas though- oh well,
perhaps in version II?

Anyway, if anyone can help me out, I would be grateful.

I have not been at the latest ProTOS but at the ProTOS in Ulm and this
even consolidated my opinion stated above. I do _not_ doubt that there
are some people who still use Ataris professionally, but the majority
of people does not consider Ataris professional tools. Most people
nowadays even don't know what an Atari is (this was entirely different
about five years ago), you can't buy them in most computer shops, many
companies who supported Atari have gone bankrupt (although there are
still a few of the best left).

I still would like to see a demo of MagicMac on our PowerMac 6100 :-)

My younger brother (aged 9) has an atari 520 STFM (diskdrive, no hard disk, using a colour display) and I would like to bring him something to play with.

So please, could anybody recommend a good shareware game and tell me where to find it (filename and ftp site). He is into any kind of game that's fun and interesting, be it simple arcade or more complex strategy type of games.

Please respond by e-mail, as I do not frequently read this newsgroup.

Yes, they existed for a short time, and I have even seen one at the
computing department of Edinburgh university. Maybe it's still there...

Good points about my condescending tone. Sorry about that. I should have
left out the nationalism. I just don't have much tolerance for those who
whine about not liking a publication, when they have some choices, including:
a) not reading said publication, or b) publishing one that's better.
I can certainly understand that people do not like to be preached to by a
know-it-all American. But remember, I'm only one person, and I don't
represent anyone except myself, so don't please don't be too judgemental.
I'll keep in mind that this is a computer net, not a political net.

4956. Atari magz

Newsgroup: comp.sys.atari.st
Date: 1994-12-08 20:32:57 UTC
From: donm@ucon.gun.de
Message-ID: <1994Dec8.203257.12981@ucon.gun.de>
Source record: 175049

(I just know this is gonna get misunderstood by some, but here goes...)

Regardles what we all may think of various ST mags the fact is that ST Format sold more copies than both other U.K. glossies combined. Yes, *combined*! I don't know ST Apps circulation but it could probably be safely thrown in as well without affecting the balance. We may complain all we want that people do not recognize quality, etc. - what else is new?

So instead of bellyaching about how bad Future is (actually it's Pearson's now... or whatever the new owner is called), anyway, instead of whining on about the publisher you all can just as well be whining about the "average" Atari user. That makes (or doesn't make) just as much sense! Because, all a publisher is doing is providing what the great unwashed want!

Yes, I know, a magazine also has to educate but why bother if that will only bring down the circulation by antagonizing the (more numerous) blisfully ignorant whose eyes would only glaze over (even more). The track record and commerical viability of "quality" mags in a narrow market like Atari's is certainly a reason *not* to get too technical!

Heck, if I had a quid/buck/DM every time *assorted* British editors turned an idea for an article down because "it's too complicated/technical for an average reader" I'd be comfortably well off now.

Besides, when compared to German magazines even the "wonder mag" ST Review comes *way* short. *It* in turn reads like a comic when compared to ST Computer, for example. Not to mention ST Magazin (R.I.P.) which was probably the highest quality Atari mag ever. (The Dutch "ST Nieuws" - thanks to its speed and unnamed insiders within Atari - was and is the best for, well, news!)

Yes, I'm also unhappy about the monopoly situation - and believe you me living in Germany (as I do) you learn to hate mopolies (and cartels) very quickly and very much! Two examples: German Telekom (monopoly - spit) and German banks (cartel - phooey)! Excuse me, gotta go and wash my mouth with soap now... But, I digress...

The bottom line is, short of learning German (which is highly recomended anyway - heck, learning any language (except C :-)) is highly recomended!) So, short of that, why don't all these "unemployed journos" put their money where their collective mouths are and get together to create a new mag! That's, more or less, what some people in Germany did because they were unhappy with the monopoly of the ST Computer. Even though I'd be happy to continue writing a EuroNews style column for it the commercial feasability of such a newcomer at this point in time is very questionable.

Actually COMA is SHAREWARE and CRIPPLEWARE alltogether.

COMA lets you receive faxes without any limitations whatsoever. The *sending*
of faxes is limited to 500 *lines*! That's about 1/3 of a page.

I do not like the concept behind COMA. It's not very easy to set up correctly
and the GUI is not very user-friendly (IMHO).

The latest is version 2.50. It should be available via ftp on all major
servers.

> Ratsoft ST, but my BBS is now 3 nodes....

Seems to me that amongst others QBBS is missing from your list of Atari
BBS software.

Development of QBBS continues in the UK and it will run on the ST and
Mega machines plus the Atari Falcon. Its not multi line in the way that
your PC board supports multiple serial ports but will run external
programs and so your BBS can be easily customised.

There are a number of possible mods that can be done to the Atari
ST(e) serial port so that it will do 38400 on a standard ST or faster
on an accelerated machine thus taking advantage of todays faster V.FC
modems.

Regards

Isn't the ROM-port an expansion port of some sort?

You can pug in scanners, EPROM-boards, ETHERNET-cards, and even a CD-ROM
adaptor is available for the ROM-port.

You can customize your Atari with more RAM, Grafix-boards, MIDI, hardware-
accelerators like PAK, SCSI-stuff, [HD|ED]-floppies, VME-boards in some
models, and still more and more ...

I don't get your point.

Quite the other way around ...

When you go to the major retailers, you buy the software and get the hardware
for free ;-))

The big disadvantage of thoses bundles are often the missing manuals and the
stuff is pre-installed on the HDD. It's hard to install it e. g. on another
hardrive when you bought a new one. And you have no disks as a backup. You
have to do it all on your own.

Hi! there

I can not comment on compatability of cubase with an accelerated FM but
I do have an STFM that has had the t28 accelerator fitted and also has the
TOS 2.06 Tboard fitted.

The only problem I have experienced with the t28 is if the cpu cache is on
then it does not always get on well with my powerdos and datanet
cartridges which are used here to network a number of Atari ST's.
With the cache off all works fine.

The T28 has proved itself to be an excellent addition to the ST and the
performance increase over the standard machine is clearly visable to the
naked eye. Add NVDI or Warp9 ontop as well and the ST flys.

No comments on the ease of fittment as I had mine fitted by system
solutions so as far as I'm concerned it was very easy :-)

Don't you think The statement there is only one Atari magazine is a bit
misleading Rich.

With future aquiring St review it may well come to pass in the Uk that there
will be only one glossy Atari mag on the newsagents shelves.
However there are other magazines available in the UK that cover the Atari
computers and also there are the overseas mags to.

Yeah I know that to get them means a subscription (or a friend overseas to send
them to you) but overseas dwellers have had to subscribe to get the Uk produced
magazines also :-)

The lack of any visable (on the news agents shelf) competition for STF is
possible not a good thing for Atari users wanting mags but I don't see that
this will bring about, as the subject implies, the death of Atari.

There is a large number of dedicated, enthusiastic Atari users around the world
and the machine will not lie down and die overnight. For my money it'll go on
to be the Morris Minor of the computer world.

> (2) Advertising. Everyone knows that Format charge a hell of a lot
> more than Review did. Will Format lower their prices? Like hell.

Can't see that they would lower prices, lets face it the magazine is produced with one aim, to make mone for Future. Ok the staff may be enthusiastic and knowledgable about the subject matter (or not !) but they goto work for the same reason future publish mags... to make money, just like most of us ?
Well those of us who arnt skiving at college :-)

> (3) There will be less coverage of Atari in the main stream press,

Can't argue with that one.

> Feedback very very welcome from any parties concerned, I know you are
> on the net Format, so please, lets hear your comments. Tell me this is

1040 STf - works perfectly
1040 STf - boots up and the drive works fine, but has a problem
accessing the hard drive and is doing some weird things
with memory in Tiger CUB. not sure whats up with it.
SC1224 color monitor - dials on side, not upfront
Canon 24 wire printer
some software

want to sell the whole package for $350 which includes s&h.
feeling pretty firm about that price.

please contact me via email.
thanks

Cr> audio, which doesn't come as standard with any falcon.

Well, not if you have a fast enough IDE drive, and lower the sampling
rate a bit... Then you are able to do atleast 8 tracks. I read
somewhere that some new HD software (was it SHDRIVER) could do upto
2.5 Mb/sec with the IDE interface.

Geneva works fine with most replacement file selectors, including Selectric and most versions of UIS III. However, there do seem to be one or two older versions of UIS that do not completely follow the normal method for intercepting trap #2 and therefore do not istall themselves. The Little Green selector also works.

The confusion in this area might arise from the fact that the Geneva Manager menu and the Task Manager use a Geneva-specific file selector function call that only produces the Geneva item selector. The replacement item selector will still appear in all other programs though.

: I want to connect a 1.44 Meg Floppy drive to my 1040STe. I got a file
: from the umich.edu FTP site that talks about replacing the GAL inside the
: computer to drive this size floppy. Has anyone else done this and has it
: worked for them? Will I be able to drive an external 3.5" 1.44Meg floppy
: and/or replace my internal drive with one? And, is there anything else I
: would need to make this work? Thanks for any help.

I've connected a 1.44mb floppy to my STE, what you need to do is the
following:

1: Put in the 1.44 mb floppy! :) (should work ok)

2: Make a small circuit that will detect when you've inserted a 1.44mb
disk and switch the clock from 8 MHz to 16MHz and vice versa.

3: Check if it works with a 1.44 mb disk. It probably won't work 100%.
(Most standard original Floppy controllers can't handle 16 MHz
properly, some WD1772 -02-02 can though, although most of them can't.
my WD 1772 02-02 could alomost handle it. Reading was no problem, writing
was troublesome, and formatting impossible)

4: Exchange floppycontroller for an AJAX FDC. (Can even handle 32 MHz (ED
floppys)) An Ajax is pretty expensive, somewhere around 50-60 USD

Hope this helps!

Regards, Tommy

: And a REAL mouse, not this cheesy (pun intended) POS that Atari makes.

: Also, lets finally SEE (and not just hear about) a notebook version. ANd
: let's stop talking about products that won't be out for 18 months and then
: are discontinued along the way because they're old news when they're finally
: made available. In other words, the manufacturer should shit or get off
: the pot.

A minitower would be nice, as well as a lot of expansionslots. (Smart
design, please!) With the soundcard, SCSI-interface and Video as cards.
And a couple of independent DMA-channels. For convenient data-transfer.
With the right design, the expansion-cards would not need memory, it
would use ordinary memory, and use the DMAs to get the data.
Economical to upgrade, and easy to make compatible.

Harddisk as standard isn't one of my favourites, as well as a certain
amount of memory. Prefer to get it as bare as possible, to make it easy
to shop around, and use existing HW.

Regards, Tommy

4979. GOOD ATARI WORDPROCESSERS...!!!

All these ravings about good Atari Word Processers or
Document Processers...

One Big problem with German ones is the lack of good spelling/Thesaurus
support...

The other problem is these later version need a high res monitor and
4 megs of Ram and a hard disk....

How about a good FAQ on Word Processers/Document Processers and lets
distinquish the differences here...

Please don't list German ones like Script 3.5, that are only German,
the German only ones can be in their own section...

Also list old versions, ones that do need hard drive support ones that need a
high res monitor, ones with scalable fonts, how much ram is needed for
graphics and number of pages, bugs and machine type, etc....

Any takers on this...??

>
> What internal SCSI adapter should I get? Do I have a choice? About
> how much do they cost?

Having spoken to Tom Harker at ICD it seems the AdSCSI Micro isn't directly compatible with the Mega STE but apparently can be 'made to work' and I know someone who has done it but don't know exactly how. So it seems the only choice you have is the Atari effort, which I've just seen a someone is advertising for sale in here.

I'd lie to be proved wrong in this if anyone can come up with some supplier details and costs.

: add.x +(An), Dn 10 10 16

: > Usually (An) and (An)+ uses the same amount of CPU-cycles!!

: seems true...

Calculating clockcycles needed for certain instructions is a whole science, since the design of the ST makes the benchmarks presented by Motorola for the 68000 not correct.

First of all, The MMU in the ST "evens" out all instructions clock-cycles to an multiple of 4, thus an instruction always takes 4, 8, 12, 16, 20 etc clockcycles to perform. (a 14 cc instruction grabs 16 cc's)
But that's not entirely true, in some cases 2 following instructions that needs a non multiple of 4 clockcycles to perform, "melts" together, and uses the number of clockcycles stated in Motorolas Benchmark.

This a very annoying fact when writing overscan-software for the ST, if you don't have adequate tools.

I've seen several sources that will measure the amount of clockcycles an instruction or routine needs. If there is an interest I could mail it here, it isn't very long, approx 3 kb ascii.

It was a long time since I played around with this, so there might be an error or two.

EB> companies are producing clone TOS-type machines independently. If
EB> they (had) hung on till TDSM (had) come(s) out I reckon STR would
EB> (have) experienced a sudden revival. I maintain that TDSM is the
EB> Falcon's killer application (apocalyptic with an Audio Out
EB> modification). I hope Future are watching.

Errr ..what TDSM ? I'M still on the lookout for new Falcon software :-)

I agree with your last little bit BTW and find the timing of this swoop to be very odd to say the least . The Active Atari userbase that Is left is IMO almost entirely made up of people who ,to attempt to put a generic term on it ,are semi-pro or hobbyist's ,who use there machines for some sort of creative ends (be that Music,grahic arts,programming,drafting or whatever) or maybe only aspire to that as the case may be :-) . They would also in general be long time Atari users and probably consequently more mature <G> .This does not seem to be the audeince that will be attracted to STF in it 's current incarnation and perhaps more intune with what we would think an STR reader would have been so unless the adapt they will not gain the market increase they hoped and we will look elsewhere to read news etc and likewise Suppliers will seek us out in these places so they won't get the Ad revenue either .

ON the other hand the fact is though that Pearsons have BOUGHT STR not been given it ,you don't pay for something you don't intend to use so lets see what there intenetions are ... usless they have some irrational hatred of Atari users I doubt if there intention is to kill it (I assume Roger Shephard isn't a major shareholder of Course <grin>). If they get it right I don't think I'll care that STR was sacrificed (f course I'd have prefered the other way round) . If they get it wrong well there are many options and small scale Atari publications who may be able to step in a make a go of it.Or maybe I'll just save the money to by software with !

In keeping with anthemic summing up lines at the bottom of some messages recently . Heres one to mull over

The Atari Jaguar is the best investment I've ever made! I had the chance to see the much touted SNES Donkey Kong Country over the weekend. I have to admit its cute, but the SNES itself is far inferior to the Jaguar. I firmly believe that Atari has a one year jump on the comptetition and they are determined to STAY in that position from this point forward. Tell your friends that they no longer need a $2000 PC to play DOOM, we have it for our Jag's, IN our living rooms, on our 27"+ SVHS TV's and in FULL surround sound! Way cooler than 14" PC monitors! Tempest 2000, Alien vs Predator and DOOM are reason enough NOW to invest in 64-bit future power. Tell your friends that more software is on the way. Guess I'm just one happy camper... And the $149 CD-ROM player is coming soon.

4989. Cubase questions....

Newsgroup: comp.sys.atari.st

From: pgl@draco.bison.mb.ca
Message-ID: <3c90m9$o59@draco.bison.mb.ca>
Source record: 174955

Just a couple of quick questions:

What's the latest version of Cubase?
Does it require more than one meg?
Does it have a hardware dongle?
Is there a mailing list?

The reason I ask is that there's a local ad selling version 3.01. Please reply via e-mail ASAP. Thanks!

So how low does your Trinitron sync? I have the NEC 3D. A simple hardware switch (easy to build if one is competent, but I paid 20 pounds to System Solutions, London for one) lets me use it in both modes (I think, if your monitor syncs sufficiently low, it is just a matter of which pin is detecting a contact).

I use, and very much like, That's Write 3.

I used to use Signum 1 and 2, and bought my Atari largely because of
Signum. It's the only possible WYSIWYG word processor for mathematics on
any machine (or used to be; don't know what exists now). The
problem with Signum, though, is that almost everyone who needs to write
mathematics has by now changed to TeX.

That's exactly the problem.

But OPENDOC is a standard which everybody has agreed upon. That would perhaps
be the solution for the future.

That's bloody typical!
Its simple; these faulty PC's should be hunted down and destroyed.
I can just see it: Mr.ST owner takes painful steps towards
owning a PC, saving up his hard earned cash and blowing the whole lot
on a spanking new Pentium only to get a kick in the knees for his
troubles.
I personally wouldn't buy a P60 or P90 whatever even if
the those 2M chips were sold; you would have to wait a few years for
those distributed to be depleted by other mugs. There are tests around
however. So if you find a dodgy Pentium in the shops, just there and
then make a casual public announcement. The shop owners are bound to take
note and promptly get on the dog to his distributor, and those responsible.

Still, suppliers should know already though, and for some time, and
its criminal that they continue to sell bugged PC's.
If you have to upgrade get the DX66, or stick with the well
loved 68000 series and get a MAC.

Yeah. 'Think MACs are easy to use machines like our trusty ST.
Although, I'm holding my breath for a few years sticking to my 68000 friend;
wait till a standard comes along with a clean working machine, with
support. RISC series of computers will be the norm then.

OK, I see that there sometimes is a reason, but since atari made that enormous flaw with the DMA chip in early STe's (personal experience of it, too), I seem to like everything that's open to public and standard. It makes life so much simpler for us users.

Compromise.
The design of those needed special chips should be free for everyone. Making a lot of third party production available.

> with a real TT.

The key point being that MagicMac doesn't "emulate" a TT, or any other
hardware. It provides an Atari-compatible AES/VDI/GEMDOS/etc environment
for applications to run in, at the full speed of the host processor.

Opposite to your evaluation, I wouldn't be surprised to see a Quadra
(depending on the model) running ST software at 2-3x the speed of a TT.

But, we'll just have to wait to see what information filters in from
Germany (and the UK) when actual testing is done (and how much compat-
ibility MagicMac has achieved).

With most languages, such as C wtc, you use fsel_exinput, but this only works for TOS versions >1.4. Most programs get round this by putting a box with text in it on the screen under the fileselector, but this causes problems with oddly sized selectors such as UIS, in that you can't actually see the text.

I don't think there's a way to put text in the fileselector in TOS 1.02, but I may be wrong with regards to UIS...

From: sbrown@cee.hw.ac.uk
Message-ID: <D0JL01.FpG@cee.hw.ac.uk>
Source record: 174976

I wonder if anyone can tell me how I can contact the Sozobon X team. I've tried to e-mail Jerry Geiger at jerry@zelator.zelator.de, who is listed in the documentation as the man to contact. However, after about four days I had a message back saying the mail had failed.

I think there's a quite serious bug in the jas assembler, release 7. It appears to fault on null branches - it places the bra opcode in the output with no operand so the next instruction's opcode is taken as the operand for bra; as you can imagine this means the program can jump anywhere.

It's a serious bug because null branches are generated when you place a return statement at the end of a function - and functions usually have returns at the end of them.

I'd appreciate if someone could tell me a contact address to report this (or has it already been reported?) and if anyone knows if any FTP sites have release 6 of the binaries which work properly.

Thank you in anticipation. And Merry Xmas.

For Video/Image processing I can actually recommend the Falcon, haven't you seen
the faboluos APEX MEDIA for the Falcon - IT AMAZING!!!
It utilizes the DSP in its full and things like Morphing, Block rotating, zoom etc.
etc. etc. are VERY fast indeed. And you can also buy the EXPOSE-framegrabber-card for
the Falcon and then use it with APEX MEDIA. It grabs very fast say 25 frames/sec. in
512x380 resolution in 65536 colors!!

Can the TT do that for a reasonable price??? I think NOT.

Hi there,

Is MagiC v.3 for the Falcon out yet?????

I just can't wait, I must have it if it's out. MultiTOS is just too slow for me and
I'm convinced that it's not the Falcon's fault, but the AES in MultiTOS.

> exactly a good way to encourage potential advertisers.

I think this happened before, and quite honestly, we don't know what happened. Maybe one of us is losing his mind, but we don't hesitate to send out media kits.

But there are two reasonable possibilities. There was a time when we had a media kit, but Sean didn't want to send out an outdated kit and he had to wait for a rather long time to get some information he needed for the new kit. People could have been forgotten.

Also, if we get too many requests (one week, we got 30 requests, more than we expected in such a short period of time), the "more likely to advertize" will get them sent first.

Perhaps our judgement on who was more likely to advertise was poor.

I do seem to recall seeing your name somewhere, perhaps on GEnie? If you're who I'm thinking you are, then I have sent you email in the past on news and stuff. As has been posted several times on the past on here and on .announce, if anyone has a small quip about a new product or some other kind of news, we'll be happy to include it in our news section without charge.

Since you didn't put your address in the message, I suggest you request a copy of the magazine and the media kit. If Sean doesn't sent it to you, I will. Your ad may be just that little bit that we need to get the second issue out the door. Send your request to these two addresses:

doughert@babbage.csee.usf.edu and
pdirect@delphi.com

Sending to both will decrease the time it takes him to get the message.
Be sure to tell him that you want to advertize.

>
> Perhaps mine was an isolated case, and I simply fell through the cracks.
>

Whether it is or not, it's not excusable, and I'm going to get with Sean
and try to make sure this doesn't happen again. It's funny, though...
until we started getting occasional messages here and there about "why
didn't you respond to my email?", etc, we thought we were doing an
exemplary job of keeping up with email and always responding.

We quicky discovered why so many developers often didn't respond. On top
of being busy, they have the same misterious problem we have of somehow
losing some mail.

>
> P.S. I've still never even seen the magazine.
>

We'll correct that. Make sure Sean gets those messages and you'll have a
copy of the magazine and media kit as fast as snail-mail will get it to you.

The 55 Mhz DSP in your machine is a relatively slow DSP, I don't remember the name of
the type, but it only performs half the instructions per clock cycle as the 56001
in the Falcon does. So it isn't really faster, it's just clocked at a higher freqency.

Of course, it would have been a disaster if the 68040 couldn't do that.

So what should be the standard languages, in your opinion? Unless a dead language, e.g. Latin, is introduced as an international means of communication, there will always be users in some countries that do not understand the one, two or even three languages into which the manuals have been translated. Introduction of an international standard language would have great benefits to people all over the world. It would be sufficient to learn one language, besides your mother language, to be able to communicate with people from any nation! I know that English is some sort of de facto standard, but I don't like this situation at all. English speaking people become to proud; they often think that everyone else has to speak English, too; some even suggest that foreign software should come with an English manual and so on. Citizens of countries that do not speak English have to speak English, because most scientific publication is done in English! Why not choose a dead language or a newly designed language (like, e.g., Esperanto) for international communication?

Source record: 174975

I have the original atari laser printer. It has worked fine, but
now I get paper jams more than 50% of the time. These are not
"real" printer jams.. before the paper even reaches the drum
something must tell the printer that the paper has jammed, but in
reality it is just sitting there not crumpled not jammed 'not
nothin''..... by the way the hand feed works fine .....
any help would be appreciated
Thanks

Nope, the hw in falcon uses 32 bit memory accesses, while the CPU uses 16
bit. That's why the memory is 32 bits wide.
(With a CPU-speeder fitted in the expansionslot, with a CPU of it's own,
it is possible to have TT-ram)

Hi Folks!

Quite often the pointer of my mouse is hidden (sometimes after answering a non-modal dialog (i.e. in VIEWER.APP). And it becomes not viewable again.

What can I Do, to see the pointer again? - is anywhere a program(may be an Accesory), which does this automatically or by a hot key?

Ciao, Arnt

That's a problem of the OS. We use VDI which is based on the ISO GKS standard.
To use graphic boards, we need 3D system calls (there is a 3D GKS standard,
too).

We have to talk with 2B and no|Software if we want to do that. And I think
we should do it.

From: npetrlik@public.srce.hr
Message-ID: <3c9ud7$atd@nippur.irb.hr>
Source record: 174986

Hi to all !

I have 1040STFM, HD 60, and a DD disk drive.
Recently, I bought 100 HD noname
disks already formatted to 1.44MB and tested.
I format them with Fastcopy Pro to 11 sectors,
82 tracks with verify on. (No errors occured while
formatting). But, when I try to copy some files
on that disk (with Kobold2) then ... errors got
appeared ...
I've tried to change the interleave and skew factor,
but without any major improvements ...
Maybe I must change some other factors, or I must
format the disks several times?
Does anyone had the same problem?

Please, help!

> understand it (7up, QED 3.2).

Yes! The VA-protocol is great! I'm right now working on a MOD-player that supports it! Great just open the module-foldern in GEMINI and doubleclick on a module, and then my moduleplayer plays it!
Everest and LZH-shell understands it too, I would like to see that al new-written programs support this great protocol!

CD

On the Falcon it has to be on a longword-boundary...

> Just put something like
>
> Real_screen = Screen_base && $ffffff00;

> or so. Forgive me, it's a long time ago I programmed C.

real_screen = (screen_base + 0x100) & 0xFFFFFF00
works fine on a ST (note that you have to allocate 32000 + 256 bytes!)...

CD

But it's not much work (my PC came with a nice uninstall program) and
costs you maybe 60,- DM for floppy disks. And, BTW, I got manuals for
all the programs which came preinstalled on my PC (and which I deleted
after uninstalling them to make enough space for Linux, but that's an
entirely different story :-)

I would like to propose a way to satisfy people who are disillusioned with the state of Atari magazines. Write our own!!

I assume most people reading and posting to this newsgroup have access to the World Wide Web. Therefore it would be possible to set up a WWW page somewhere and have real users, i.e. you lot, write articles, reviews, etc. for it. For those of us who don't have to pay to use the Internet (like students like me) this would be cheaper than paying out for a magazine; and rather than having cover disks bumping up the price, the WWW page can have links to download the software.

I know there are various WWW pages for the Atari already. But the problem is they are operated by one person who usually has other commitments and can't spend the time to write a whole magazine. Therefore somebody would have to be nominated editor, preferably the person whose account is being used to store the pages. Then people could submit articles which could be included. The magazine could change on a fortnightly or monthly basis with back issues archived so they can be downloaded.

The advantages go beyond the quality and technical aspects. Because the magazine would be independent there would be no editorial pressure from some publishing company; the magazine would have what people want in it; and multimedia can be used, something which cannot be employed in either newsgroups or paper magazines.

If there are enough people with the drive to produce the magazine, then it should go ahead.

What are your views? Would you support a magazine by writing articles and accessing the WWW page? Would you like to be editor or be responsible for a particular topic?

I would be willing to edit such a magazine (at least in the short term) if I have support.

Please reply to the newsgroup so everybody can debate this and so I can gauge reaction. Tell us if you think it's a crap idea, but try to be constructive in criticism - enough time and money is wasted sending flame wars and arguments around the world.

Thank you for your attention.

Cheerio.

5036. Atari ST games sale-very cheap

Newsgroup: comp.sys.atari.st
Date: 1994-12-09 17:58:51 UTC
From: jamesd@cg57.esnet.com
Message-ID: <3ca5sr$rtf@cg57.esnet.com>
Source record: 174918
Cross-posted to: misc.forsale,comp.sys.atari.st,rec.games.video.marketplace,rec.games.misc,ca.forsale

I have the following Atari ST programs for sale. They are all
original disks but, with exceptions noted, are parted from
their documentation.

I pay postage at the prices shown to anywhere in the US.

Their Finest Hour, The Battle for Britain, on 2 disks. $9.

The Black Cauldron: Sierra Software, Walt Disney, on 2 disks. $9.

Falcon: Spectrum Holobyte, on 4 disks, $13.

King's Quest: Sierra Software, 2 disks plus a 360 page book
"King's Quest Companion," all for $10.50 (The book by itself is cover
priced at $14.95)

King's Quest II: Sierra Software, 2 disks $9.

Flight Simulator II, 3 disks (2 are scenery disk) $10.

High Roller: Mindscape, 2 disks, $11.

--------the following programs are each on a single disk----

STWars: Miles Computing $7.50

Outrun: Sega $7.50

Hades Nebula: Gamebusters (requires color monitor) $7.50

Airball: Microdeal $7.50

Super Cycle: Epyx 7.50

MadLibs, World's Greatest Party Game: Price/Stern/Sloan $7.50

ALSO

PrintMaster Plus: Kyocera Unison Inc. $13.

I am interested in developing a GUI based relational database for the ST or more so Falcon whcih will take advantage of the DSP and fast processing power.

However I am not sufficiently 'clever' to do it myself so I'd be very grateful to hear from other interested parties.

: OK, I see that there sometimes is a reason, but since atari made that
: enormous flaw with the DMA chip in early STe's (personal experience of it,
: too), ...

I got nailed by this as well, but the DMA chips in the early STe's were
not flawed. They were left over chips from the production of the STfm
in which they worked very well, and still do. They just didn't work in
the STe's. That _was_ soon corrected with the new DMA chips.

Just in case there might still be someone out there that needs to know,
the "bad" chip is part # C025913-38. The "good" chip in an STe is part #
C398739-001 or later.

re: Marathon on the Power Mac.

Seen it. Played it. Deleted it. Not impressed enough. If I hand't played AvP, I might have gotten into it. It's a nice game, but even on the Power Mac when you compare it to it's predecessors it's just rates up as a DOOM clone for the Mac. Same thing goes for Castle Wolfenstein, thought it sounded like a neat idea, but compared to the pure speed and instant gratification of the Jag version it just didn't cut it. If I were a pure Mac head, I would probably love Marathon, since I'm a litle more objective, and since you brought it up. Count me as at least one person that is underwhelmed.

My dream Atari would be a Falcon clone, with a 68040 and up; Tower or desktop case. CD ROM built in configurations as well as different internal HD options would be available.

It would also have to be cheaper than the current Falcon. Also, give me stereo RCA or 1/4" outputs and a 1/4" mike input in the back. Beef up the A/D converters or offer an optical in/out. Then advertise it as bundled with a few Falcon specific programs, especially Cubase Audio Falcon. Advertise it in Keyboard Mag, Electronic Musician, etc.

Then send a demo unit to these magazines for review.

. . . Then take my money, as I would gladly part with it.

They can be taught.

>The other problem is these later version need a high res monitor and
>4 megs of Ram and a hard disk....

High res monitor is the minimum requirement for any word processing
anyway (you cannot distinguish the letters if you use 80 columns or
more in ST-Med or ST-low). Also the SM 124 & 144) have 70Hz rate, which
is good for your eyes.

Better still, get SM 194 (I had it for 3 years, it was wonderful) or
Falcon with 17" :-)

>How about a good FAQ on Word Processers/Document Processers and lets
>distinquish the differences here...

Yes, it would be great.

>Please don't list German ones like Script 3.5, that are only German,
>the German only ones can be in their own section...

No, please do list of all available programs and their abilities, and
tell there if it's available only in German Language (or in Swahili).
No discrimination, please.

From: contacts@mits.mdata.fi
Message-ID: <3caean$b28@prime.mdata.fi>
Source record: 174906

Ok, I have this MAG multisync monitor, which has Mac and PC VGA-
connectors, as well as colour coded CMYK+sync -connectors (BNC).
There's a cable available (it's quite expensive) that has VGA
in the other end, and 5 BNC's in the other.

Does this cable give me RGB-output from Falcon to MAG (I have
the VGA-adapter in my Falcon)?? Is the PC-cable compatible with
Falcon's VGA-adapter?

Atari Man (atariman@aol.com) wrote:
: The Atari Jaguar is the best investment I've ever made! I had the chance
: to see the much touted SNES Donkey Kong Country over the weekend. I have
: to admit its cute, but the SNES itself is far inferior to the Jaguar. I
: firmly believe that Atari has a one year jump on the comptetition and they
: are determined to STAY in that position from this point forward. Tell
: your friends that they no longer need a $2000 PC to play DOOM, we have it
: for our Jag's, IN our living rooms, on our 27"+ SVHS TV's and in FULL
: surround sound! Way cooler than 14" PC monitors! Tempest 2000, Alien vs
: Predator and DOOM are reason enough NOW to invest in 64-bit future power.
: Tell your friends that more software is on the way. Guess I'm just one
: happy camper... And the $149 CD-ROM player is coming soon.

Well there are problems, The Atari Jaguar will mostlikely not make it at the the end of 1995 or the begining of 1996. Tempest 2000 and Doom are also PC games as well now (Tempest 2000 was anounced last month for the PC), Aliens vs Predator (wow, a Wolfenstien clone, big deal), I can modify doom to do Aliens Vs Predator, its a simple hack, in fact with my scanner, I can take pictures of your AvP and scan them in and use them in Doom or Doom][, Wow! Also for 90 US dollars you can put the PC's video to a 30 Inch TV, but my question is why? PC 's can also do more than play games, a lot more things than play silly games, thats why you get more and therfore have to pay more, games are a plus for the PC, but there is more to life than just to play games.

The Jaguar has been said to be 64 bit, but I really doubt it, I really thing think its just hype... I dont care what Atari advocates say, I just dont believe it is 64-bit, if it was it would be more expensive and more powerfull. The 3-D games it plays now should not be bogging down the game system, but yet they are, if the Jag was TRUE 64-bit, it would fly through all the graphics and such, but sadly its not much faster than a 486-25....

Don't believe the hype!

: any worth buying which could do this. And don't make me laugh with the sound
: 'quality' of the GUS or SB.. :P

The REAL Good soundcards are the AWE-32 and the GUSMAX. The AWE-32 for the PC
just kills the falcon (its $200.00) and it just blows the falcon away in just
about every aspect. At this point, I would not go for the Falcon using MIDI or
anything else unless you are an Atari advocate, you would get ripped off...

5050. '040 board??? Why not '060 board instead?

Newsgroup: comp.sys.atari.st
Date: 1994-12-09 21:33:30 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <ELKKAFUSUp@stingray.manawatu.gen.nz>
Source record: 174912
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I was just wondering after seeing all the posts about 040 boards for the Falcon...

Why aren't they making an '060 board for the Falcon instead??? I don't know the specs of the '060, but if it's out - why don't companies drop any '040 board and work on an '060 board?

I guess that the data lines will probably be 64 bit instead of 32? (This is just a presumption). Would that create problems with current Falcons?

Or is it that the '060 chip is more expensive than an '040? I don't think this would matter as if you are going to buy an accelerator board, surely most would go for an '060 as it is bound to be faster than any '040 (unless someone made a _serious_ mistake).

Do you all agree/disagree?

Falcon-IDE is faster than Falcon-SCSI when you compare the same drive models.
The SCSI-DMA is somewhat crappy.

>>Get your facts straight. The Falcon comes *with* a SCSI2 port. No acsi

You can fit a SCSI-drive inside the Falcon. All you need is the right cable.

5052. hard drives and the Link II

Newsgroup: comp.sys.atari.st
Date: 1994-12-09 22:24:35 UTC
From: michael@cs.umass.edu
Message-ID: <3calf3$js5@kernighan.cs.umass.edu>
Source record: 174913
Cross-posted to: comp.sys.atari.st,comp.ys.atari.st.tech

I recently bought a Link II to replace my old ICD host adaptor, and I wanted to have a chain of SCSI devices instead of just my old 85 meg drive. I bought the Link II so I wouldn't be locked into using the 85 meg with the Atari. Well, since it already had it's resistor packs for termination, I figured I would make that the end of the chain and connect the other drive in from of it (a SyQuest). The SyQuest was SCSI id 4 and the 85 meg was SCSI id 0.

When I hooked the Link II directly to the 85 meg and had no other drives connected, it worked fine. When I put the SyQuest into the chain, I couldn't reliably access the 85 meg; it wouldn't make it through a boot. The light on the interface was on, so it was getting *some* termination power at least, but I trashed my C partition real good trying to access it.

Since then, I've gone back to my old host adaptor, and used the new ribbon cable to make the 85 meg the first on the chain. I've also taken the resistor packs off of it and slap a terminator onto the external connector if it's going to be the only drive, and it works fine with the chain or not.

My question is, what sort of requirements and restrictions are there when using the Link II? I don't remember seeing anything that would apply to my situation in the docs, but I'll look again. Anyone else have similar problems?

Does the Papyrus RTF export still generate tabs as CHR$(9) and paragraph ends as '\',LF,CR? This causes problems for other RTF readers. Why not produce the more normal \tab sequence and \par ?

BTFAX is a fax recieve module only it does not transmit faxes.

It works fine here on my BBS where if the modem returns the fax connect string
the mailer runs BTFAX and in comes the fax ready for later manipulation.

Could you please define "much better throughput" for me?

The internal CoNnect-ZModem gives me about 1620cps with pre-compressed stuff
and a 14k4 modem (DTE 57k6).

This is very close to the physical limit of this kind of connection. If an
external protocol would allow me to d'l with about 1625cps, I wouldn't say
that is a dramatic improvement at all.

] faster than a falcon.

Duh - Processor speed means nothing. Try getting a 486 to outperform
a Falcon as far as sound & graphics operations go.....

The machines are badly constructed, not the manufacturers fault, but
IBM's fault for making them badly in the first place & hence damning
all other companies to have to make them backwardly compatible with
the original XT architecture, rather than something that might have
worked properly....

Anyone seriously saying that Windows is faster than GEM (on a comparable
machine) obviously either doesn't know what they are talking about,
or are just trying to cause trouble.

According to Microsoft's specification both representations are allowed.
But while playing around with MS Word 5.1 on a Mac I noticed that it
messed up many things at import. Obviously they are not capable
of properly implementing their own specification :-(
Since version 3.60, Papyrus now uses a different way to represent
paragraphs and tabs (\par and \tab) and paragraph attributes
(preceded by \pard every time they change) in RTF export. Though this
makes RTF files slightly bigger, it makes it more compatible
with sloopy RTF readers.

At the Bonn proTOS, Overscan were showing off their multimedia package called
Overlay. Very nice, package indeed. You can import graphics, sounds, clips,
and use Speedo texts. You can make objects responds to the mouse, etc.

They plan to combine it with an experimental IR transciever, which could control
external devices, like CD players and VCRs.

If you don't get manuals and some kind of install disk, it's likely that
the dealer in question was including the software illegally.

Some vendors, like Gateway, practically force you to get a certain set of
software with the system. Gateway is so standardized on DOS, Windoze, and
a set of MS apps that their licensing agreement allows them to put it all
on a system install CD that they always include with the computer.

> with a real TT.

I disagree with all of the above statements. The Quadra I have is faster and more capable in just about any respect than the TT my friend used to own, to the extent that its cooperative multitasking works better than MultiTOS did. (It goes almost without saying that the STe I had was extremely far behind the Quadra and the TT.)

Probably the most noticeable difference would be in graphics. With the chunky-pixel format and the use of dual-ported VRAM, Quadra built-in video has tremendous speed advantages over TT video. CPU access to VRAM is not blocked by DAC access because of the dual-ported nature of VRAM, and chunky pixels are far more efficient for drawing than the interleaved bitplane format. Since Magic Mac doesn't try to map Atari hardware registers to Mac registers - it is an actual operating system - there should be no overhead.

If you are looking for an Atati TT030, may be tou can find it at Goodman Music in Universal City. They have TT 2Mb St/50Mb Hd for $1,200, and the 605 Laser printer for $399.

> run it that slow.

Not really true, for many reasons. For example, a RISC processor tends to be able to do more work in its registers rather than accessing external memory.

> 1 MIPS on a 486, also, would be noticably slower than 1 MIPS on a 68040,
> because, for one thing, the 68040 instructions tend to do more, and
> secondly the 68040 instruction set is much better organized than the 486
> kludgy piecemeal crap instruction set, so it's easier to write good
> efficient assembly and easier to write a compiler to take good advantage
> of the instruction set.

680x0 instructions do tend to do more - but they are also slower. It's a known fact that the 486, clocked at the same rate as a 68040, is faster at integer operations (but not at floating point).

The 386 instruction set is quite different in protected (32-bit) mode than in other modes. Don't fall into the trap of believing that the design of the 386 is completely asinine. It's not. (The 486 and Pentium use essentially the same instruction set as the 386.)

> In reality, even the 386 is NOT a slow processor. The problem is that
> most companies, expecially Microsoft, don't want to put in the time to
> develop a compiler that is capable of properly optimizing for the
> instruction set.

Untrue. All the major compilers out there support optimization for the Pentium (which, incidentally, also speeds code up on the 486 and 386, though the benefit is less than that on the Pentium). OS/2 is a pretty nice example of a major program that is Pentium optimized.

Curiously enough, said optimization consists in large part of avoiding the more complex instructions and trying to use a core set of simpler instructions which execute very quickly on the Pentium. (The other major part, which probably doesn't benefit the 386 and 486 at all, is playing with instruction ordering so that integer instructions come in pairs that nicely feed the Pentium's dual pipelines.)

> The easiest kind of processor to develop a compiler for is a RISC
> processor because there aren't any weird nuances to a very complicated
> instruction set. Instead, there are only primitives. Too bad that even
> that is beyond the intelligence of Microsoft programmers.

You couldn't be more wrong! Developing a RISC compiler is much harder
than developing a CISC compiler. RISC compilers have to do all sorts of
things to get the expected performance out of the processor; they usually
have to actually know about many of the internal design details of the
CPU, in order to avoid emitting a sequence of instructions that could
cause the pipeline to stall. One part of the advantage of RISC design is
that you get to shift some of the responsibility for high performance off
to the compiler writers.

Another advantage of RISC is that compiled code will generally come closer
to hand-coded assembly performance than compiled CISC code can, but, on
the other hand, writing assembly yourself is not as easy if you want to do
it really well.

Nah - it's already been done. You can buy RAM drives that are SCSI
devices. However, they all use conventional DRAM, as far as I know - it's
too much of a niche market at the present to try to design a part
specifically for such purposes.

I saw one such device a few years back that looked like nothing other than
a bunch of SIMM sockets in a 5.25" half-height drive case. Just slap it
in a free drive bay, connect power and a SCSI cable, and you've got *fast*
(and expensive) swap space. Seagate also sold (and maybe still does)
these monstrous drives on an 8" drive frame; they could hold hundreds of
megabytes of RAM, plus a 3.5" drive or two (controlled by the onboard
processor via its own SCSI bus) for permanent storage. In effect, I
suppose you could call it a hard drive with a cache the size of the
drive. All I/O requests would be fulfilled the RAM, while it chugged away
in the background at writing all changes out to the drive(s).

The best thing would be to have it local to the CPU: a memory bank plus a
memory copier (which would allow it to operate as efficiently as DMA
driven disk I/O with respect to allowing the CPU to do work during swaps).

Not true. As far as I know, IDE has no requirements with respect to the
I/O method. Also note the emphasis I added to my original words...

> That's not what I've seen. *Everyone* I know that has a PC with a

Hmmm.... all I know is that most people I know of go for a higher end
SoundBlaster and a CD with such an interface.

> Gee, that's certainly expensive! Sheesh. But they'll pay $700 every
> year to upgrade their CPU.

Only the kind of person willing to spend a lot on a fast SCSI card would
do that. I don't think most people pay $700 every year to upgrade their
CPU.

> It'd be nice if more motherboards had SCSI on the motherboard...

It certainly would, since as far as I know, those are also often the
fastest SCSI implementations for the PC available (and they cost the
least, too).

> IMHO IDE is fine for DOS. As soon as you start multitasking (especailly

Though you seem reasonable in the other post, this is absolutely wrong,
unless you define the word "fine" to include running at molasses speeds
and, in many cases, not running at all. :-) (A DOS app might be compiled
for / written in 8086 code, but if it requires a significant amount of
free RAM, like anything approaching 600 K, it's pretty much toast without
a 386 or better and a memory manager.)

Though 16-bit Windows apps don't need a 386 or better, Windows itself
really does.

These games *are* written by very intelligent programmers. You didn't get the point, did you?

Let's put it this way: Can any amount of awesome programming make the old Atari 8-bit series processor, a 6502 at 1.79 MHz, display graphics at a reasonable speed at ST resolutions (320x200x16 for starters)? Gimme a break - we're talking about a screen whose memory footprint is about half of the address space of the 6502.

Who says it has to be games? The new generation of fast processors (Pentium, PowerPC) makes all sorts of other kinds of things possible. For an example, look at the graphing calculator demo program that comes with Power Macs. (Actually, though it's billed as a demo, it's a useful program.)

The fix for the FDIV bug was actually in the works long before it became
public knowledge. (Which is a big part of why people are so mad at Intel
- it is a bug they should have let people know about, but they tried to
keep it a secret.)

�omparing the AT&T DSP3210 (which is what is used in the 660AV and 840AV) and the Motorola 56001 is tough. Although the raw MIPS values are probably similar, the 56001 operates on 24-bit integer or fixed point quantities, while the 3210 does 32-bit floating point math (somewhat unusual for a DSP). Also, because of the 24-bit word size, the interface between the 56001 and the Falcon is somewhat clumsy - the 56001 cannot directly access main memory; a comparatively slow DMA channel is used to load data to the 56001 memory and retrieve results. In contrast, the 3210 in an AV Quadras can directly address main memory. This has tradeoffs of its own: you then get bus cycle contention between the DSP and the CPU (mitigated by cacheing).

: Would you please give a some sort of a description of MiNT, as many of
: us have no idea of it's capabilities (graphics, programs for it, hardware
: requirements, SCSI? etc.). Thanks!

Ok, just a quick description:
MiNT is a multitasking operating system for the ATari ST series of computers
(including TT and Falcon etc.) which reminds of unix in many ways. It is
pretty fast (I think it slowed the system down on average 4% or somethng).
With a complete MiNT system you can make everything look exactly like
Unix running a shell. Then again you don't have to use it like that.
It supports all atari resolutions, all Atari programs in theory plus
many compiled unix programs, runs on any St basically and supports all
Atari peripherals. Sounds like an OS I would use (and I do :)

Oh, and it's freeware.

The proTOS in Hennef was _way_ better than the one in Ulm!!

>I still would like to see a demo of MagicMac on our PowerMac 6100 :-)

As I've probably written before, a 680x0 with a PMMU is required to run
MagicMAC!

Possible combination would be:

68020 with an external PMMU
68030
68040
68LC040

I believe there's a crippled 040-version (EC?) available, which _cannot_ be
used to run MagicMAC.

I think ASH are preparing a FAQ about this. I'll let ya' all know when I get
hold of it ;-)

Oh, DEFINITELY, it would have to conform to whatever "standard" was
appropriate... now if Atari CAN conform to "standards", thats another issue :-)

5089. Falcon for Sale

Newsgroup: comp.sys.atari.st
Date: 1994-12-10 06:38:56 UTC
From: elvis@watserv.ucr.edu
Message-ID: <3cbie0$deb@galaxy.ucr.edu>
Source record: 174941

Hi,
As you may have guessed from the subject, I have a Falcon for sale.
I've found that I'm not using the features that the Falcon offers over
my ol'1040, and the money wouldn't hurt, so...
Its a Falcon 4/0 that I bought a little over a year ago. I can throw in
with it the VGA adaptor, a SCSI-II cable and the Falcon version of ISHAR.
I'd like to get $800 for it, but am open to offers. I'm also open to
suggestions for the best way to handle the sale, since $800 is a lot for
COD, but its also more than I'd want to ask to someone to send before they
have the Falcon, and I certainly don't want to send it without any
assurances about getting paid.

Thanks,
Andrew

You could also use CoMa which should be available on different ftp-servers.
It's cripple-ware - you could only send 500 lines but you could receive
a fax without problems. It costs about 100,- DM to get the key. (It also
supports voice modems and allows the user to run a small ftp-server.)

HM> It's in German, though :-)
It's in English (and German - if you want to ;-)

You can't use HD floppy disk on a DD only disk drive,
you will have to replace the drive with a HD one, then you
can format them to DD track standards....

: The key point being that MagicMac doesn't "emulate" a TT, or any other
: hardware. It provides an Atari-compatible AES/VDI/GEMDOS/etc environment
: for applications to run in, at the full speed of the host processor.

: Opposite to your evaluation, I wouldn't be surprised to see a Quadra
: (depending on the model) running ST software at 2-3x the speed of a TT.

After a talk with the developers at CCD in Germany, who produce the
TEMPUS editor, it is their experience with Mac Magic, that it is about
10% slower than an Atari model with comparable processor and clock speed
(i.e. a 68030 Mac will be slower than a TT, and the Quadra will be much
faster).

Compatuibility in the first version is already high, although it will
allow only for very well written GEm and TOs applications to run (do not
forget, no ST/TT emulator, but an OS)

If you would have been at the ProTOS fair in Germany, you would be amazed.

I really doubt that. Last I heard, the '060 was slower than a
PowerPC-601, which is (Mhz-for-Mhz) the same integer speed as a Pentium,
and somewhat faster on floating-point.

>Unfortunately or not most people buy PCs because everyone else has one.

Yup. Especially people who know nothing about computers, which is very
bad, because you _need_ to know something about computers to maintain a
DOS/Windows system.

> nothin''..... by the way the hand feed works fine .....
> any help would be appreciated
> Thanks

I had the same problem with mine, it would take up the feed a second
or two after the printer 'clicked' into motion, causing the paper to
be a second or so behind where it should be. When the printer says
"OK, paper should be here, let's print" the paper isn't, and it stops.

It doesn't do it any more, not since I dropped my monitor on the single-feed
tray and broke off both the mounting arms. Go figger.

I just have to say that I can't stand to use a Mac.

I was in a computer lab trying to use a Mac LCII to use MS Word. It was so slow, I couldn't get any work done. The responce was awful.

When I asked to be moved to one of the Quadras, it was an order of magnitude faster at processing, but the interface wasn't any better. It took just as long for windoes, dialogs and menus to do anything. It was still unbearably slow.

Ironically, I ended up going to a 386-25 to actually get work done.

I don't know how they did it, but Apple did an impresive job of destroying the performance of the 68040.

And people who do know something about computers don't buy Atari systems because they are systems with a history but NO FUTURE. The best thing that could happen for Atari users is that someone (Darek M.?) develop a TOS subsystem optimized to run under modern multitasking OSes on modern CPUs (Pentium, PPC, maybe Alpha).

IR>Imagine we as members of comp.sys.atari.st[.tech] are designing the
IR>new Atari range.

IR>What would you want in it???

Well I think the most important thing is to have loads of expansion slots
so the user can customise the machine to suit his needs. This IMO is the
main fault with the falcon, along with the desktop/tower case it should
have come in. As for the technical specs of the slots, I think PCI is
probably a good one to go for, and possibly (I'll probably get flamed for
this) a couple of ISA compatible slots so normal PC cards can be plugged in.
I know the ISA bus is a bit pathetic, but it's quite adequate for things
such as serial/parallel ports and sound cards, and means that these
devices would not need to be developed from scratch for this new machine.

I don't think anything should be standard on the motherboard (apart from
the obvious necessary things like keyboard controller etc, as if the user
decides to upgrade then the motherboard stuff would just be a redundant
waste of space. Just sell a 'standard' configuration machine with all
the necessary cards included, with the stuff that you would have put
on the motherboard.

The actual processor used is not really important. Well, it is, but
what's more important
is designing a decent OS (a development of TOS and GEM possibly), and
a good system, with obvious things such as using a 32 bit bus
with a 32 bit processor (!) and SIMM memory slots etc.
Plus a nice big memory map so we can add things like 64 serial ports for
big BBSs, 2nd 3rd and 4th monitors for DTP and CAD etc, 5 parallel ports
for those plotters, printers and computer controlled
beer pouring devices, etc etc etc..!! Oh and don't forget
the 128 Megs of RAM. (Well, remember when 128K was enormous? And
you often see file servers with 64Mb or more these days...)
You get the idea.

Thats what I reckon anyway!

>anyone explain this to me. Also, what is mint.

MagiC is a replacement operating system for Atari ST(E)/TT computers.
It provides a preemptive ("true") multitasking environment in a very
fast way. A new version is to be released in 1995 which will run on
the Falcon030 and on 68030/68040 Apple Macintosh computers, thus making
it possible to use Atari programs (probably no games) on the Mac.

MiNT is a operating system extension for Atari computers. It provides
multitasking capabilities in a unix-like way for TOS- and TTP-programs.
If the AES knows about MiNT you can run several GEM applications at the
same time as well. You then have MultiTOS.

I saw one of the programmers yesterday. He told me that the demo doesn't
work on TVs which don't send a RGB signal (there are also problems with
some multisync monitors), and that he won't fix it (for now) since he
doesn't have much time.

As far as I know, no Mac uses the 68EC040. I don't think I've seen any
accelerator boards with them, either. The EC040 lacks a MMU, and you need
one to do System 7 virtual memory.

The correct answer is 0 (zero), You should get a better calculator, I
sincerely hope you don't make your home-budget on that one...

The problem in the Pentium is, as far as I can tell, a faulty algoritm,
which causes errors when calculating numbers with certain bit-series.

Papyrus is an excellent program, the best WP processor for the Atari IMO.
It still lacks many features that are available on leading WP for PC and
Mac. Word count, thesaurus, macros, colour graphics support, grammer
checker.

On the other hand it has the best interface and an excellent font panel.

This is correct. Don't forget that a Quadra or LC475 has very nice and
fast video built in. The Quadra 800 (040@33MHz) is almost 3 times fast
than a TT. And it runs in colour.

Nice to know someone actually reads my BASIC tutorials :-)

So far STF editorial have not contacted any of STR's main writers. I spoke with Nial Grimes and he is looking at writing for PC mags. Since I own and use a Mac I will be looking at a similar direction. We all have to make a living. One of my first articles in a Mac mag will be about MagiC Mac :-)

I do think that losing an ST mag in the UK is a serious blow to the market, as do all the Atari retailers I spoke to since the news of STR's death. I have said here before that I thought the same about STF, I would not like to see it closed either. Competition is healthy. Another thing is that you could get two points of view with two mags. Most major packages were reviewed in both mags. I believe this is important for the consumer. Also, STR had an up-beat POV, trying to encourage development by having both C and BASIC tutorials. A certain optimism that STF possibly lacks.

I think I'll go and run GEMBench (again) on MagiC Mac :-)

That makes no difference. It is bad netiquette to post binaries in
discussion groups. Also, if you are downloading via a dial-up SLIP link, it
takes a while to download 18K, time which the recipient is paying for.

>anything else unless you are an Atari advocate, you would get ripped off...

You have no idea what the Falcon is for. The DSP-port itself makes it
incomparable with those cheap PC-cards. Realtime automated digital effects,
D2D (up to 16 channels) running in a same screen with top-class MIDI sequencer
is not something you get for 200$.

Also, Falcon is not a synth and it does not even try to be. If you need Midi
voices get some real Midi instruments with separate outputs and internal
high-quality effects. They do not die away with your platform, and they give
quality that surpasses every cheap PC-card (I've heard them).

BTW: some comments from various newsgroups about AWE: it makes a click after
each WAW played, the ROM-sound are poor and the user support sucks...

These things that you`re mentioning here is in fact the features most Falcon's have.
Oil and watercolors are features of a painting package called CHAGALL which runs on all
Atari, but only makes sense on a TT or Falcon with at least 256 colors.

Well the reason why it doesn`t run on the Falcon is propably because it uses the
co-processor. And you have to install a co-processor in the Falcon, or else you
have to run the normal 68000-version.
I use MultiTEX myself and it runs perfectly on my Falcon, but I haven`t got a
co-pro. so I use the 68000-version of the LaTEX compiler.

I don`t know of any DSP-version - yet.

Uh, 95% of PC owners do. AFAIK, that's what we're talking about here.

>And who is talking about being '486 optimized'? Anyhow, the 486 + DOS/Windows (an upgraded

Uh, we are. I was making a point that almost _nothing_ in the PC
industry is optimised to take advantage of the '386, '486 or Pentium.

>8088 according to you) beats the falcon, so it is obvious what happens
>when you do NOT use DOS/Windows....

I don't claim _anything_ running DOS/Windows "beats" a Falcon. You seem
to be comparing Apples to Oranges. I don't think I was saying anything
about "foo is better than an Atari bar!" in this thread; I was mainly
just complaining about how the technology is underused, and how
expensive a decent TT or Intel-based system would be.

>The only thing that is important is that a 486 running whatever OS, is WAY
>faster than a falcon.

Gee, the '486 is only about 2x the speed of an '030 at the same clock
speed (AFAIK), and I don't see too many 16Mhz '486 systems... I _do_
see most '486 systems running brain-dead DOS, which means they might as
well be 100Mhz 8088 chips...

>
>You seem to think all PC users use DOS/Windows.

I seem to _know_ that 95% of PC users use DOS/Windows. When _I_ am I PC
user, I use OS/2 or Linux. But OS/2 users, [UNIX varient] users, and
Windows NT users are a very, very small group compared to the DOS users.

And only those small groups are using the "full" potential of their
systems.

> all else fails you can read your messages inside a text-editor...)

Hmm, I see your point. But QWK is well spreaded and other computer platforms may have trouble to find a reader that understands your format. And I really like QWK:s index system since it speeds things up as reader doesn't have to do those index files. And index files take very little space.

> Besides... The offliner needed (ReadMail ST) is much faster - and free.

I hope there is also ReadMail PC, Amiga & Mac :-). And that much faster point of view makes me ask, does it run with MultiTOS?

>Even if you have a single drive?

Yup. As soon as you start swapping, or even just accessing the drive a
lot (say, during compiles or running something like Windows that hits
the disk constantly even when it's not swapping), you're losing CPU
cycles to the IDE transfers, when they should be going to the running
processes.

If you know the name of another running application (be it an ACC under normal TOS or a ACC or application under MultiTOS), you can find it's application ID via:

```
int id = appl_find( "NAME\0\0\0\0" );
```

Note how the application name is padded out to 8 characters with NULLs.

If you're using Warwick's fine GEM++ C++ class library, you'd use:

```
GEMapplication other_app( "NAME" );
```

There doesn't appear to be any way of finding out what applications are actually running though. Very bozotic. If MultiTOS is running, you could find the process ID of the AES, and then find it's children...

Strangely enough, Microsoft has never AFAIK implemented RTF properly.
Their import/export routines eat plenty of formatting, which can make
transferring between word processors HELL. But that's their plan...
stick with MS apps only, and everything will work fine.

NeXT has AFAIK the only complete implementation of the RTF spec.

5138. For sale (and some things asked) (Netherlands)

Newsgroup: comp.sys.atari.st
Date: 1994-12-11 16:53:23 UTC
From: avg@cwi.nl
Message-ID: <avg.787164803@news.cwi.nl>
Source record: 174803

I would like to sell/am thinking about offering the following:

PC/GENERAL:

- SVGA video board VG-5500, ISA/ET4000 based. 1024x768 at 87Hz interlaced,
800x600 at 60Hz non-interlaced. 256 6bit colours. 1MB DRAM.
Price indication: NLG 45.

- CTX multiscan monitor (CVP-5468NI). Pretty standard 14 inch PC VGA
monitor. 30-38/47-50KHz horizontal scan. 1024x768 non-interlaced
up to 60Hz.
Price indication: NLG 220.

ATARI:

- Spektrum 1 graphics board. 1MB memory. 1024x768x256 at 72Hz
non-interlaced (80MHz pixel rate). 1152x900x256 at 56Hz
non-interlaced, still pretty good when done interlaced at 90Hz.
Maximum 256 6bit colours. NVDI ET-4000 accelerator included. Price
indication: NLG 500 (new 1000). Better deals possible when combined
with the CTX monitor.

- SOFTWARE, Unused: First word Plus 4. The latest word processor
package, currently best selling; Dutch version (which is why I
must sell it).
Price (fixed): NLG 160 (200 in the shops).

SEEK:

- Atari TT VGA/ECL switchbox (switches between standard modes and
TT high resolution monitor). Note that such a switchbox is no longer
necessary if you are using the combination of a TTM194 and a VGA
connected to the Spektrum graphics board. Current price new is
NLG 100. I'd offer 50.

- cheap 1meg ISA-based S3 video board (or any accelerated chipset
reasonably compatible with Linux X386). Current price new is 250.
I'd offer 160.

Hi Kurt,
Check all resistors out in the primary circuit, I'll bet there is one
(about 100k to 500k) which is defect. This resistor 'starts' up the
switching transistor on power up. It's connected to the +300V and the base
of the transistor. If you replace this one I bet it runs OK.
Good luck, and watch out for the capacitors voltage, with this resistor
being 'gone' the voltage will stay on the cap for quite some time.
Discharge it through a suitable resistor (100 ohm 'till 1 K or so)

I bought a MSTE in 1992 with an internal ICD AdSCSI Micro host adaptor internal. This drove a 105Mb Quantum HD and worked fine. I've since sold the machine (to get a TT), but the dealer I bought it from was 'Ladbroke Computing' (0772) 203166 (uk phone)

:-)

If I knew - then I wouldn't have to take this form of insurance.

> If you already have a SCSI controller, you may as well buy SCSI drives.
> They are faster under multitasking operating systems (eg. Linux).
> This goes for 680x0 Linux equally.

Well actually I didn't have a SCSI controller already. I was in the
situation of buying a basic (but reasonably) decent working PC and adding
a few bits myself. I had no intention of buying a SCSI controller from my
dealer as I was sure I could get one cheaper. Also I had no intention of
buying anything less than a working PC. Finally I was getting an IDE
interface for free as it was on the multifunction peripheral card.
Therefore I decided a small IDE drive was in order.

Now as it happens I bought a rather larger IDE drive as it didn't really
add much to the cost. And also as it happens I aquired a decent SCSI card
very quickly. So yes I could dispense with the IDE drive. However as I said
before its cheap and it works - and I fully intend to hang eveything else
of the SCSI bus.

Roland.

> > You read my mind. Appart from the initial IDE drive *everyhting*
> > else will be SCSI.
>
> What a waste! DAT and CD-ROM have no use for the SPEED of SCSI - only
> hard drives need it.

Its those pesky IRQs and DMA channels. I only need one set for a SSCI card.
And also don't forget I have a TT as well (this is the Atari conference
;-).

A propreitry tape or cd-rom drive doesn't help my TT much.

> Unlike hard-drives, it is quite realistic to buy tape drives
> second-hand. (it is foolish for hard drives, since you are buying

I know - I'm on the look out!

> > A Colorado Jumbo 250 PC tape drive (250Mb with compression) costs

>
> These things are useless. 250M is NOTHING these days. And the tapes
> cost a fortune compared to DAT tapes (2Gb DAT tapes are AU$30).

For relatively small HDs they are still quite cost effective. However once
over the 250Mb mark the cost of the media (DC2120s @ 15ukp approx) start
to outway the cost savings of the drive. 60m DAT tapes are available in
the UK for 6ukp (+VAT) in bulk. Really I would like a DAT drive!

:-)

A friend of mine has an Atari 1040STfm with 1M of memory. He wants to expand the memory if possible to 2M or more and has heard of a mod to do this. The memory is the original soldered-in type. Can anyone help or point him in the right direction? Thanks.

Battle Chess is not all that bad, either. The entertainment aspect of it aside, it's also a pretty good chess program. I have the ST version and the Windows version. The Atari version is FAR superior.

selick@acs2.bu.edu wrote:

: I just got a 1040STF and it came with Mark Williams C v2.1.7 with a 3.0.6
: update set. Is there a newer version available? Are there any files I should
: know about - pd libraries, must have accessories, etc.? Will it work with
: Mint, and can I use the pd mint libraries?

I use 3.0.5. There is a 3.0.9 but as far as I know no newer version
beyond that. I use it on my Falcon to continue MicroEMACS development. I
am not aware of any 'need to have' PD additions. MWC comes as a very
complete package on it is own.

I can't get the linker to work with mint, it always bombs. The rest
works well in a TOS window.

You could try to compile the mint libraries for use with MWC, but there
will be quite a bit of handwork involved.

And a quick plug for Logic Audio Falcon too (sorry, Pekka, couldn't
resist! :-) CD quality DA with Time Stretching/Pitch Shifting, Audio
Groove and Audio to Score streamer. And a wonderful (IMHO) sequencer, too.

Cubase & Logic are _the_ Falcon music applications... check them out :-)

Great show!

It was nice meeting so many guys and gals in the Atari community, and
although many people were feeling a bit let down about the state of Atari
in general, it was nice to see that people in the Atari scene are still
supporting it fully.

And the Vic-bashing-Trenton debate was good too, although Neal O'Nions
capably stopped any fists flying :-) :-)

Hope the next one goes down equally as well.

C ya next year,

The thing you are looking for is called `term'. The latest version
ported for MiNT and MiNT-Net is 2.2.4. Be sure to install the same
version on the `other' side in order to avoid compatibilty problems.

> So, my ST will be using the host's IP address. I understand that Iwill

You have to relink ncftp with the libtermnet.a on your ST in order to
use the term connection for ftp.

Bye,
Knarf

Not true, you can format them and use them, provided your floppy drive does
not have the auto density detector (I am not sure what it is called but it
automatically detects the density of the disk inserted).

The trick is to trick it to see a DD disk instead of a HD disk. Do this by
covering the hole at one of the corner, which is on the other side of the
read/write hole. This hole does not have the slider to close it, so you can
use some sticky tape. Just make sure that light cannot go through it, as the
detector works on light.

:>:your DOS apps run fine on an 8088 (drag out those old XTs!) and *all* of
:>:your Windows apps run fine on a '286.
:>
:>how was talking about DOS? I do not use DOS.
:
:Uh, 95% of PC owners do. AFAIK, that's what we're talking about here.

no, we were talking about PC's. Not PC+DOS+Windows. I don't care what most
users do with their PC, what interests me is: what are PC's capable of
and what are Ataris capable of.

:
:>And who is talking about being '486 optimized'? Anyhow, the 486 + DOS/Windows (an
upgraded
:
:Uh, we are. I was making a point that almost _nothing_ in the PC
:industry is optimised to take advantage of the '386, '486 or Pentium.
:
:>8088 according to you) beats the falcon, so it is obvious what happens
:>when you do NOT use DOS/Windows....
:
:I don't claim _anything_ running DOS/Windows "beats" a Falcon. You seem
:to be comparing Apples to Oranges. I don't think I was saying anything
:about "foo is better than an Atari bar!" in this thread; I was mainly
:just complaining about how the technology is underused, and how
:expensive a decent TT or Intel-based system would be.

lets assume most of the pc technology is underused. Then _still_ the PC's
are the faster machines. So what why do you want a TT?

:
:>The only thing that is important is that a 486 running whatever OS, is WAY
:>faster than a falcon.

I still think this is true.

:
:Gee, the '486 is only about 2x the speed of an '030 at the same clock
:speed (AFAIK), and I don't see too many 16Mhz '486 systems... I _do_

:see most '486 systems running brain-dead DOS, which means they might as
:well be 100Mhz 8088 chips...

that maybe true but who cares about this? it is the potential of the
hardware that counts (as long as there are OS`s around that use this
potential, these OS's are around BTW)

:
:>:I know all the DOS apps I run at work are 8088, and all the Windows apps
:>:(including FrameMaker 4 and CorelDraw 3) would run on a '286. At least
:>:I'm running Os/2 to get _some_ use out of the Protected Mode of the
:>:'486...
:>:
:>:You seem to think that Atari users have absolutely no experience with
:>:other, more modern systems.
:>
:>You seem to think all PC users use DOS/Windows.
:
:I seem to _know_ that 95% of PC users use DOS/Windows. When _I_ am I PC
:user, I use OS/2 or Linux. But OS/2 users, [UNIX varient] users, and
:Windows NT users are a very, very small group compared to the DOS users.
:And only those small groups are using the "full" potential of their
:systems.

so? does this make an expensive TT setup desirable?

MagicMac is *fast*! I was using it on Saturday at an Atari show on a
Mac portable (a 170), and Papyrus was working faster than MS Word on
the same machine with the same file... It seemed equal to my TT, and
this was only a lowly 25Mhz 030 machine :-)

5164. Falcon Spec Sheet

Newsgroup: comp.sys.atari.st
Date: 1994-12-12 10:18:59 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <3ch82j$hlt@dux.dundee.ac.uk>
Source record: 174831
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Okay, here it comes...again!!!

Atari Falcon 030 Specifications

CPU: Motorola 68030 32-bit microprocessor @ 16MHz w/ 32-bit bus
FPU: Motorola 68881/68882 @ 16MHz (optional)
DSP: Motorola 56001 Digital Signal Processor running in parallel @ 32MHz
w/ 32kWords (24-bit) of local zero wait state static RAM
ROM: 512kB
RAM: 1, 4 or 16MB(14MB usable) on daughterboard (RAM is 32-bit wide)

Expansion bus: Internal 'Processor-Direct' slot for 386SX emulation
(third party 386SX emulator nearly completed) or other
co-processors/etc.

Video: (See below for specific video modes/resolutions.)
16-bit BLiTTER @ 16MHz (also handles hard drive access)
Accepts external video sync to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan support
Hardware-assisted horizontal fine scrolling
VIDEL (video controller) sits on 32-bit bus

Audio: Stereo 16-bit Analog-to-Digital DMA input
Stereo 16-bit Digital-to-Analog DMA output
Eight 16-bit audio DMA record/playback channels
SDMA sound/DMA co-processor

Ports: 128kB cartridge port
2 9-pin mouse/joystick ports
2 15-pin STe enhanced analog/digital controller ports (Atari also
has new analog controllers w/ a joystick, 3 fire buttons, and a
12-key keypad)
MIDI IN, OUT/THRU
Bi-directional parallel port
RS232C serial port
SCSI II w/ DMA
Analog RGB/VGA/composite video connector
Stereo headphone out (1/8" mini-jack)
Stereo microphone in (1/8" mini-jack)
DSP port (up to 1MHz data transfer rate)
RF modulator for TV hookup
Localtalk compatible LAN (up to 250kbaud transfer rate)

Misc: Internal 1.44MB 3.5" HD floppy
Internal IDE 2.5" hard drive (optional)
Pre-emptive mulitasking OS (MultiTOS) w/ adaptive prioritization
and inter-process communication (also 68040 compatible)
Realtime clock and battery backed up RAM
1040ST-style case w/ internal fan
North American availability in mid-October

Price: 1MB/no HD - $799 list
4MB/65MB - $1399 list

Resolutions available on the Atari Falcon030 (c) 1992 Atari Corp.
Written by John Townsend
==========
This document may be re-printed again and again as long as the Atari
copyright remains intact.
==========

A couple of notes: Unlike previous machines, there are just too many
resolutions to give each resolution a name. Therefore, I will do my best
to describe what the resolution is and which monitor it is on.

- NOTE: TV and a Color Monitor are the same.. by Color Monitor, I am
talking about the standard SC1224. By VGA, I mean a standard VGA
Monitor.

40 column modes ("column" means the number of x pixels divided by 8)
---
4 color, normal, TV: 320x200, 4 colors, 2 planes
16 color, normal, TV: 320x200, 16 colors, 4 planes
256 color, normal, TV: 320x200, 256 colors, 8 planes
True color, normal, TV: 320x200, true color

4 color, interlace, TV: 320x400, 4 colors, 2 planes
16 color, interlace, TV: 320x400, 16 colors, 4 planes
256 color, interlace, TV: 320x400, 256 colors, 8 planes
True color, interlace, TV: 320x400, true color

4 color, normal, VGA: 320x480, 4 colors, 2 planes
16 color, normal, VGA: 320x480, 16 colors, 4 planes
256 color, normal, VGA: 320x480, 256 colors, 8 planes
True color, normal, VGA: 320x480, true color

4 color, line-doubling, VGA: 320x240, 4 colors, 2 planes
16 color, line-doubling, VGA: 320x240, 16 colors, 4 planes
256 color, line-doubling, VGA: 320x240, 256 colors, 8 planes
True color, line-doubling, VGA: 320x240, true color

80 column modes
---
2 color, normal, TV: 640x200, 2 colors, 1 plane
4 color, normal, TV: 640x200, 4 colors, 2 planes
16 color, normal, TV: 640x200, 16 colors, 4 planes
256 color, normal, TV: 640x200, 256 colors, 8 planes

True color, normal, TV: 640x200, true color

4 color, interlace, TV: 640x400, 4 colors, 2 planes
16 color, interlace, TV: 640x400, 16 colors, 4 planes
256 color, interlace, TV: 640x400, 256 colors, 8 planes
True color, interlace, TV: 640x400, true color

2 color, normal, VGA: 640x480, 2 colors, 1 plane
4 color, normal, VGA: 640x480, 4 colors, 2 planes
16 color, normal, VGA: 640x480, 16 colors, 4 planes
256 color, normal, VGA: 640x480, 256 colors, 8 planes

4 color, line-doubling, VGA: 640x240, 4 colors, 2 planes
16 color, line-doubling, VGA: 640x240, 16 colors, 4 planes
256 color, line-doubling, VGA: 640x240, 256 colors, 8 planes

and lastly.. there are compability modes for ST Low, ST Medium, and ST High on both VGA monitors and SC1224 monitors. (On a color monitor, ST High is achieved by using the interlace mode).

Also, the ST Monochrome monitor (the SM124) will work with Falcon030 as well. However, it only supports one resolution: ST High Resolution.

All modes on a TV can be overscanned. This means multiplying the X and Y resolution by 1.2. For example, modes with 320 pixels of horizontal resolution (X res) will become 384 pixels across, and modes with 640 pixels will become 768 across. Overscanning is done in the X and Y resolution. You can't do them independently. Special Note: On a VGA monitor, overscan is "faked".. since the video hardware doesn't have the capability to do overscan on a VGA monitor, we made it so that if a overscan mode is set on a VGA monitor, you still see the normal size screen, but the screen is a window onto the bigger overscanned image. Make sense? We did this for compatibility. This way if a game that has an overscanned starup picture can use the same pic on both the VGA monitor and the TV monitor. Pretty cool, eh? <grin>

BTW.. Overscan can NOT be set from the desktop. The AES and Desktop will work just fine with it, but because you can't see the parts of the screen, we thought that that option shouldn't be available from the desktop. We don't want to confuse people. However, Overscan can be set using a new XBIOS call (Vsetmode()).. so it is still available.

I hope I haven't made any mistakes. I triple-checked this document in search of errors and I couldn't find any. If you do find some, send me Email on GEnie (to TOWNS) or CIS (70007,1135) and let me know.

-- John Townsend, Atari Corp.

P.S. Anyone who would like to reprint this message, please do so! The smaller the number of times I have to type that message, the more my fingers with thank you! ;-)

After looking at this one more time.. one point to clear up: By saying SC1224 Color Monitor, I mean any Color Monitor that Atari

have manufactured for the ST/Mega/STE/MegaSTE computers. Clear
as mud? ;-)

Organization: Dept of Computer Science, Utrecht University, The Netherlands
Lines: 470
In-Reply-To: kjohnson@castor.cs.uga.edu (Kristopher Johnson)

I found this file on the local ATARI Company's BBS : (original in Dutch)

This article is written by Wilfred Kilwinger (Support Manager) for
Atari Briefing, the newsletter by Atari (Benelux) B.V. for the Atari
user groups. It was specifically stated that it could be reproduced. I have
translated it in English with the assumption that an English translation
would be considered the same as the original.

The original also contained a description of all the features of the Falcon
which have been reproduced here a zillion of times so I did not include
these.

Atari custom chips

VIDEL

The VIDEL takes care of the video functions of the system including
overscan, overlay mode and true color graphics

COMBEL

The COMBEL is the system manager of the Atari Falcon030. This chip controls
all system functions. Also the BLITTER is built in in this chip.

SDMA

The SDMA is the Sound DMA and controls the sound part. We have built in a
unique matrix switch function in this chip (more details in the second part)

KEYBOARD PROCESSOR

The keyboard processor has been improved and is now also suitable for high
resolution mice.

Besides the above custom chips the Atari Falcon030 has a number of standard chips like the Motorola 68030 and 56001 DSP. Another important chip is the CODEC in which the 16 bit AD and DA converters are located.

Video modi

As you can see in the survey of Operating System calls
the video hardware is complete sotware controllable. The following
combinations can a.o. be chosen:

Mode Resolution Bit planes Colors Palette

ST LOW 320x200 4 16 4096
ST MED 640x200 2 4 4096
ST HIGH 640x400 1 2 4096

True Color 640x480 8 256 262144
320x200 15bpp 32768 N/A

The last mode asks for some explanation. Here there is no color palette but
15 bits per pixel to describe the pixel itself. The format is
RRRRRGGGGGXBBBBB. VDI supports this mode thus programs that have not been
written for this mode specifically can use it nevertheless.
X is the overlay bit and can be used for video titling and special effects.

320x200 16bpp 65 N/A

This mode is called the slideshow mode, is not supported by the VDI, you
are on you own. X is an extra green bit.

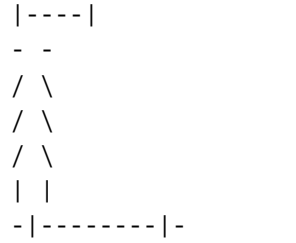
True Color in 640x480 is not possible because of the bandwidth of VGA monitors.

Mode Resolution Bit planes Colors Palette

VGA 320 of 640 1,4,8 2,16,256 262144 (Overscan
Video 200 of 400

With Video we mean the Atari SC-monitors, the TV modulator and/or the
composite video output.

All modes can be gegenlocked. With adaptors we convert
the 15-pole video bus to thee standard Atari or VGA connections.



Matrix coupling

To make the system performance in the audio part as good as possible Atari
designed a miniature 'telephone exchange' that can easily connect the
source devices to the receiving devices. Also it is possible to make more

than one connection at a time.

De volledige beschrijving van bovenstaande functie's staat in de Falcon030 Developers Documentation.

VIDEO SETMODE

```
int setmode( int modecode );
```

The setmode(int modecode) call is used to place the Falcon/030 SHIFTER into a specific mode. A bit-encoded value (called a "modecode") is passed to setmode() to set the mode. setmode() returns the previous mode that was set.

To help make the building of modecode values easier, here is a table of defines:

```
#define VERTFLAG 0x100
#define STMODES 0x80
#define OVERSCAN 0x40
#define PAL 0x20
#define VGA 0x10
#define TV 0x0

#define COL80 0x08
#define COL40 0x0
#define NUMCOLS 7

#define BPS16 4
#define BPS8 3
#define BPS4 2
#define BPS2 1
#define BPS1 0
```

Using these defines, you can build a modecode for any possible mode. For example:

```
For True Color Overscan:
modecode = OVERSCAN|COL40|BPS16;

For ST Medium Compatibility mode on a Color Monitor/TV:
modecode = STMODES|COL80|BPS2;

For ST Low Compatibility mode in PAL on a Color Monitor/TV:
modecode = STMODES|PAL|COL80|BPS2;

For 256 color, 80 column mode on a VGA monitor:
modecode = VGA|COL80|BPS8;

If you have a modecode and wish to know how many bits per pixel it
has, use the following:

if( modecode & NUMCOLS ) == BPS16 )
do_something_cool(); /* You have true color mode */

The setmode() call will return the previous modecode set. You must use
this value to get back to whatever mode you were in before you made your
setmode call.

int mon_type(void)

The mon_type() function will return the kind of monitor that is currently
in use. Here are the possible return values:

0 = ST monochrome monitor
1 = ST color monitor
2 = VGA monitor
3 = Television.

void ext_sync( int flag )

This function sets or clears external sync. If flag is set, external
sync is enabled. If flag is clear, then internal sync is used.

SOUND-calls

locksnd();
Used as a semiphore to lock the sound system. From other applications.

unlocksnd();
Used to release the sound system for other applications to use.

soundcmd(mode,data);
This command is used to get or set the following sound parameters.
If a negative number is used as the input then the current setting us
returned.

MODE OPERATION MEANING

0 LTATTEN Sets the current left channel output

1 RTATTEN Sets the current right channel output

2 LTGAIN Sets the current left channel input gain.
```

3 RTGAIN Sets the current right channel input gain.

4 ADDERIN Set the output of the 16 bit signed adder to
receive it's input from the ADC, Matrix or
both.

5 ADCINPUT Set the input the the ADC. The input can either
be the left and right channel of the PSG or the
left and right channel of the microphone.

6 SETPRESCALE Used for compatability. This prescale value
is used when the DEVCONNECT() internal
prescale value is set to zero.

setbuffer(reg,begaddr,endaddr);
This function is used to set the play or record buffers. REG selects
playback or record, while begaddr and endaddr are the buffers beginning
and ending locations.

(int) reg - (0) Sets playback registers.
- (1) Sets record registers.
(long) begaddr - Sets the beginning address of the buffer.
(long) endaddr - Sets the ending address of the buffer.

setmode(mode);
This function is used to set record or playback mode. The modes are as
follows:

MODE OPERATION
(int) 0 8 Bit Stereo
(int) 1 16 Bit Stereo
(int) 2 8 Bit Mono

settracks(playtracks,rectracks);
This function is used to sets the number of record or playback tracks.

setmontracks(montrack);
This function is used to set the output of the internal speaker to one of
the four tracks currently playing. The internal speaker is only capable of
outputing ONE track at a time.

setinterrupt(src_inter,cause);
This function is used to set which interrupt that will occur at the end of a
frame. If the frame repeat bit is on, this interrupt is used to allow for
double buffering the playing or recording of sound. Interrupts can come from
TimerA or the MFP i7.

buffoper(mode);
This function is used to control the operation of the play or record buffers
in the sound system. The input to this function is a bitmap. If mode is set
t0 -1 then the current status of the buffer operation bits is returned.

NOTE: The sound system contains a 32 byte FIFO. When transferring data to
the record buffer, software MUST check to see if the record enable (RE) bit
was cleared by the hardware. If the bit was cleared then the FIFO is flushed,

if not then software must flush the FIFO by clearing the record enable (RE)
bit.

dsptristate(dspxmit,dsprec);
This function is used to tristate the DSP from the data matrix.

gpio(mode,data);
This is used to communicate over the General Purpose I/O on the DSP connector.
Only the low order three bits are used. The rest are reserved. This call,
depending on the mode, can be used to set the direction of the I/O bits, read
the bits, or write the bits.

devconnect(src,dst,srcclk,prescale,protocol);
This function is used to attach a source device to any of the destination
devices in the matrix. Given a source device, this call will attach that one
source device to one or all of the destination devices. This call also sets
up the source clock and prescaler, protocol and protocol source if used.

sndstatus(reset);
This function gets the current status of the codec.

buffptr(pointer);
This function returns the current position of the play and record data buffer
pointers. These pointers indicate where the data is being read/written within
the buffers themselves. This function is also used to determine how much
data has been written to the record buffer. See buffoper().

The above is not yet complete. Atari has also routines for
JPEG and andio conversion.

For anyone who hasn't seen the latest AEO, the Falcon appears to
have been design as a 24 bit computer, partly to maintain compatability
with existing software. This doesn't mean third party boards etc can't
extent that, but it explains the 14 meg memory limit. The other captures
from Jim Allen posts to GEnie say that the Falcon chips all seem to talk
at 16mhz. Another poster mentioned here that there's an 8bit processor to
dsp channel, I guess for uploading code into the dsp, though I don't
know if that means you can't tell the dsp to load a program from a memory
location itself, which would be faster, I'd guess.
Motorola says the top speed the 56001 is clocked at is 33mhz, so the
ad/da converters must be the parts clocked at 50mhz.

>second DMA/CODEC rate. This is the same as the STE/TT.

In the very techie "test" of the Falcon in the German C'T you can read a
differend story:

"[external/internal clock, prescale 4-24 or 128]. Internally there is a
27.175MHz clock to select the for the STe known sampling rates of
12.5KHz, 25KHz and 50KHz, or 32MHz in order to use the full bandwidth of
the memory transfer, with an sampling rate of 62.5KHz on eight 16bit
channels. This is also the upper limit for the external clock."

(if the about dosn't make any sense then it is probaly because my german
is even worth than my english)

Well, the NEC 3D is one of the exceptions. It can sync downto 15 kHz
and can thus display TV. I was fiddling with my BlowUP settings and
got downto about 18 kHz, and the monitor still worked.

Anyhow, I just downloaded the X-perience demo, which I'm told will
work on VGA. We'll see...

Yes, but do you know how it works?
A read is done on the ROM port. The lower bytes of the address are used
to pass on information to the board connected to the ROM-port.

>You can customize your Atari with more RAM, Grafix-boards, MIDI, hardware-
>accelerators like PAK, SCSI-stuff, [HD|ED]-floppies, VME-boards in some

>I don't get your point.

My point is:
It would have been much easier to expand the Atari ST when you would have
a REAL expansion bus on the outside in stead of a ROM-port.

By te way: Not everybody can afford TT or Falcon, so not everybody has
VME, SCSI etc. Also: we are not all hardware cracks.

Did I mention any names? :-)
I wasn't talking about English citizens who live in Belgium, but
about *all* people in England (England is near Germany: just across
the channel and to the left a bit...).

Is there any chance of the ST Review team starting up another ST Mag - perhaps digging ST User out of it's grave???? Future have only bought the rights to ST Review - they can't stop the writers migrating to another mag!!!

Also, does this move mean there may not be any more of those UK Atari shows??? Unfortunately I missed the one in London yesterday (Darned trains :( ) but I would definately be annoyed it Future killed those off as well....

Neil.

: I don't think there's a way to put text in the fileselector in TOS 1.02, but
: I may be wrong with regards to UIS...

If you are using Lattice C then you can use fsel_exinput no matter what TOS you are using, they have their own routines I think.

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on

which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.
Use the appropriate decompression program for this.

- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

Part of this is dependent on you having the GNU msdos-utilities available
at your site. If you don't, ask your local system operator how to transfer
files to/from MSDOS disks.

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:

- mdir [CR] to show disk-directory/space left.

- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)

- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")

- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt test1.zip"

- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

- eject [CR] to eject disks from disk-drives that don't have "eject buttons".

: and TOSwin and I can run only TOS programs.

As far as I know you can only multitask many programs with Multitos, MagiC or
Geneva.. Multitos runs under MiNT.

>ST Review - they can't stop the writers migrating to another mag!!!

Remember, Review bought out User, so STFormat owns the rights to both of
those names.

Vic Lennard has moved onto a Mac magazine (and is heavily pluggin MagiC Mac).

Trenton (St Format editor) has also moved on, so the Format editor space
is vacant at the moment.

>Also, does this move mean there may not be any more of those UK Atari shows???
>Unfortunately I missed the one in London yesterday (Darned trains :( ) but I
>would definately be annoyed it Future killed those off as well....

No - we had a vote on it in the meeting, and there will definately be more
shows (with a longer discussion forum next time). I think most exhibitors
had a pretty good weekend at the shows.

And did the trains _really_ run a whole day late...? That's pretty bad
service...

>
> What were the problems -- was it HD access problems?
Yes, that was it!

This is what I made out of it when trying to analyse the problem.

When writing the DMAchip did some sort of systematic displacement of the data in the stream (something like 16 bytes OK add 4 unknown write 12 of the 16 supposed to follow etc.). Well, partitioning the HD with and ol STf all was OK, and then the STE could read it (a little) but soon (I think when writing) it trashed the partitions. For every time starting up the computer one or more partitions couldn't be found.

Well, I unsoldered the old DMA chip placed a holder there (good move if I may say so myself, since I got old one when ordering the first time :( ), plugged in the new chip and now everything works just fine. :)

Again, you've missed the point. The _applications_ are all 8088. The
memory managers, which those appliations _might_ use to access > 640k of
memory via extended (or is that expanded?) memory, can use '386
instructions all they want, but the _applications_ don't bother.

>Though 16-bit Windows apps don't need a 386 or better, Windows itself
>really does.

"Enhanced" mode Windows requires a '386, "Standard" mode runs on a '286.
You wouldn't want to, though, if you had access to a better machine.

5181. Re: 8MHZ 68000 vs Pentium

Newsgroup: comp.sys.atari.st
Date: 1994-12-12 16:12:01 UTC
From: "V. Minder" <vmin@urba.ulg.ac.be>
Message-ID: <19941212.174917.366961.NETNEWS@VM1.ULG.AC.BE>
Source record: 174712

Hi,

This might interest you - though not exactly Atari-related.

ARDI (Abacus Research & Development, Inc -questions@ardi.com) has
a Macintosh emulator that runs under DOS, Linux and NEXTSTEP. They
have programmed what they call a "synthetic CPU" which gets them
plain Quadra performance on a 486 DX4/75 and over Quadra specs
with a Pentium90.

Their code is so efficient (esp. when compared to PowerMac-based
emulation) that Apple Computer itself has showed interest (you may
know that through the MAE project, Apple is thinking about encouraging
the use of MacOS on foreign platforms).

The emulator is called "Executor" and these performance matters have
been discussed on the executor@nacm.com mailing list a while ago.

Bye,

Vincent Minder
vmin@urba.ulg.ac.be

5182. Is Spectre GCR still supported ? Where can I find it ?

Newsgroup: comp.sys.atari.st
Date: 1994-12-12 16:24:49 UTC
From: "V. Minder" <vmin@urba.ulg.ac.be>
Message-ID: <19941212.175052.880758.NETNEWS@VM1.ULG.AC.BE>
Source record: 174713

Hi,

Does GCR still exist ?
From what store can I buy it ? (It'd have to be sent to Belgium)
How much would it cost ?
Do I have to buy the Mac ROMs separately ? (If not, how much $)
What are the latest Mac ROMs supported ?
Will it run fine on a TT with SCSI drives ?

Thanks for E-mailing me your information if possible (I'll try
and keep an eye on this group anyway).

I know what you mean. Should of tried Write Now.. I bet that MS Word would
also have been slow on a Falcon as well if available..

Rod,
Personal Pascal from OSS works fine with my Falcon. The best thing was
that it was $10 US. I haven't had time to program much, though, so I
can't comment on any specifics. Seems like a decent package, though.

<Regarding the comment of AvP being a Wolf clone>
It is vastly different. The graphics are incredible and really get the player involved in the game. Also the randomness of the monsters and roleplaying aspects of the game (can be Alien, Predator or Marine and each have a different mission) adds a lot to the game. The Doom Alien patch is decent but does not include these elements. It is still the same Doom- a bloodbath where the creatures are always in the same place. I am not saying I don't like Doom- it is fun. Luckily the Jag has Doom too. And the Jag is just a hair less expensive than a PC.
I enjoy computing with my Atari and with a nifty system like the Jag I can also play wonderful games (although personally I use a 7800 for gaming). Just some thoughts.

The LCII -is- a slow machine, period. MS Word is powerful, but it's also a resource hog that demands a fairly quick box to take advantage of it. I shudder to think how slowly a full bore version of Word 5.1/6.0 would run on a 16MHz 030 Falcon (but I wish we had a version of it to try). ;-)

>When I asked to be moved to one of the Quadras, it was an order of
>magnitude faster at processing, but the interface wasn't any better.

Given the same System software, the interface is the same, of course.

>Ironically, I ended up going to a 386-25 to actually get work done.

Did you run MS Word for Windows with this 386-25 or just use a DOS word processor? Not having to maintain a fancy GUI interface makes a huge difference in performance on any machine.

>I don't know how they did it, but Apple did an impresive job of
>destroying the performance of the 68040.

More likely than not, your complaints are founded mostly in your unfamiliarity with the Mac interface and the apparent sluggishness of System 7.x. Personal productivity depends greatly on what you are used to. The 040 and PowerPC Mac's actually -are- fast machines. But if you prefer something else (like a PC), nothing in the world is going to easily convince you otherwise.

Let's face it, few things in life are as simple and elegant as the Atari GEM desktop interface. But time marches relentlessly onward, and without ongoing software support and new hardware developments, it's a moot point anyway.

>Quit your damn whining. Nobody's putting a gun to your head saying you have
>to read news.

How interesting. I didn't take Mark's comment to be whining at all. He simply explained that this practice costs some people money out of their pocket and this is the reason we have separate .binaries and .sources groups. By trying to follow the net-rules, when possible, everyone can get more enjoyment and utility out of the newsgroup. Is that too much to ask? I think not.

No one is putting a gun to YOUR head to be polite and considerate of others. While it would be nice if you would try it sometime, it's still your choice.

: What were the problems -- was it HD access problems?
:

You got it. In my case, I formatted & partitioned my drive, setting it
with a 5Meg boot partition (C) and 2 40 meg partitions (D & E).
I would get scrambled directories and sub directories and the boot
partition went totally missing a number of times. Changed the DMA chip
and haven't had a problem since.

I see from your .sig, you have a Mega STe. AFAIK problems with the DMA
chips, this particular problem anyway, was only with the very early 1040
STe's.

Problem with MS Word is that it doesn't use the routines of the OS which
are supposed to do the GUI-stuff, it uses its own (AFAIK). Therefore,
MS Word is (e.g.) surprisingly slow on a PowerMac or on S 7.5 since
it cannot take advantage of the optimized OS routines.

It was announced at a UK Atari show yesterday that CLAb now own the rights to falcon.

Early 95 will see a Falcon with all the audio fixes called the Clab falcon 2. Othr machines are a 68040 and a possible 299GBP machine. They are open to suggestions as to how the h/w should develop. Most people advised their rep at the show that better graphics would be good.

Well, if it is able to run the Tempus Editor, compatibility must be
quite high :-)

(Tempus Editor is one of the finest pieces of software I've ever seen.
Unfortunately not too compatible...)

5195. Modem Problems

Newsgroup: comp.sys.atari.st
Date: 1994-12-12 20:23:33 UTC
From: lombardo@herbie.unl.edu
Message-ID: <3cibg5$2ac@crcnis3.unl.edu>
Source record: 174738

I have had a lot of trouble with my modem lately. I had to disable the auto program I have for my modem (I have a 14.4k US Robotics) just to get the modem to respond to AT commands and it will dial numbers now (without the auto program loaded) and all of the normal lights light up on the modem (MR TR etc...) BUT, the modem won't echo anything back to the computer like it used to.

When I type something I can see the light blink but nothing comes up on the screen like it used to. Along with that, when the modem connects to another modem I can see the receive light light up like it is receiving data like normal, but again nothing is sent to the screen.

I have used the same software for a long time without ANY problems. I usually don't have to even configure anything it just works fine but all of the sudden it stopped working and I don't know why. I have never had to disable the auto program before and even without that I can't get it to echo anything to the screen!

WHATS WRONG?

(I REALLY need a new computer...)

That is an obvious fix to say the least - incorporating some form of
the BlowUp/ScreenBlaster/FalconScreen software into the ROMS would be
a good staring point, and wouldn't require any HW mods at all. Incorporating
the BlowUP hardware internally should be cheap as well.

A crucial move would be to ditch the awful ST style case, and go for a proper
case - I happen to like the TT case, but just a reasonable clone case with
space for some internal expansion would be good.

As to CPU expansion, what would really hot up a Falcon2 would be the
addition of a 32 bit wide RAM option with a 32MHz CPU as standard.

I'm not waffling excessive pipe dreams here, as the core CPU hardware isn't
the tricky bit to design, anyone could knock up a 68030 machine - it's
the peripheral hardware that takes the time, and the falcon already
has that in spades :)

So redesigning the main CPU -> memory bus shouldn't be that hard ?
At a push, they could use the TT-Ram/ST-Ram kludge that the TT (and the
Amiga for that matter) uses - actually, a split bus system would
probably be better for audio applications anyway, as you could hand
over most of the St-RAM Bandwith to the custom chips & still have
the programs run at a fair turn of speed ?

Craig.

>games, a lot more things than play silly games, thats why you get more
>and therfore have to pay more, games are a plus for the PC, but there is
>more to life than just to play games.

A PC cost's somewhere between 5 and 8 times of what the Jaguar costs, so
it blody well should do some more than the JAG, but when it comes down to
the gamepower/buck factor, the Jag wins hands down and feets tied!!!

>The Jaguar has been said to be 64 bit, but I really doubt it, I really
>thing think its just hype... I dont care what Atari advocates say, I
>just dont believe it is 64-bit, if it was it would be more expensive and
>more powerfull.

Yeah, and the earth is flat! Right?

>The 3-D games it plays now should not be bogging down the game system,
>but yet they are, if the Jag was TRUE 64-bit, it would fly through all
>the graphics and such, but sadly its not much faster than a 486-25....

If the 486 really was that powerful as you clame, then the simple 2d
excuse of an GUI, WINDOWS, should not be bogging down the PC so much....

And if you still have doubt's about the power of the Jag, I'd like to
point out that I've seen the very first proto of some of the chips in the
Jag, way back when it was called Flare One in 1988. It was a small
company in Cambridge who started the development. This company had some
contact withe people who were involved in the ATW project (Atari and

Perihelion project).
At that time, the Flare One already had a 80 bit barrel shifter and integer multiplier in hardware, and som more custom hardware making the Archimedes look slow as a Intel-chip!!!

Hm. It's funny to see how people like you have to bash on other cheaper and better hardware than you've bought yourselves, just to feel better about spending too much money on a piece of fancy crap!

You are by fare not the only one, who tried to reach Toad ! I tried this for
weeks and got no answer.

But Toad is not the only company with this behavior either.
Compo US needs weeks and several faxes to answer, the producer of Cattamaran
doesen't answer at all, and since about 4 weeks I try to find information
on how mouch an upgrade from NVDI 2.5 to 3.0 would be.

I always wander how those companies want to make profit if they don't
offer any service to theire customers ?

May be this is one reason, why ATARI will be out of the market on the long
run. Apple or COmpac for instance answerded my requests right away !

Cross-posted to: ont.micro,kw.micro,uw.sys.atari,comp.sys.atari.st,comp.sys.atari.8bit

In December, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our catalog disk and our disk-of-the-month.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, December 14, 1994
DCS Course Room, Room 2009 (2nd floor)

Call 725-2068 for more information.

Hope to see you there,
Dani Roloson

Whoaa!

Since when is FLEXDISK shareware? I don't think so. Ease is commercial as is
Flexdisk.

What "damn whining"? Everything said above is factually correct.

> Nobody's putting a gun to your head saying you have to read news.

I don't know about your job, Kartik, but I'm pretty much obligated to
read the comp.sys.next newsgroups in order to stay current with my
segment of the computer industry. Besides which, whether or not one has
to read news has nothing to do with tolerating messages sent to
inappropriate newsgroups.

I don't want to read about the Green Card lottery, I don't want to hear
about "How to Make Money Fast", and I don't want to encounter uuencoded
gifs on comp.sys.next.misc. Is this clear, or is more explanation
required?

> Watch more discussion be generated about this than the actual innocuous
> posting!

Probably, although "innocuous" is certainly not the right word:

in-noc-u-ous \in-'aHk-ye-wes\ adj
[L innocuus, fr. in- + noce're] (1598)
1: producing no injury: HARMLESS
2: not likely to give offense or to arouse strong feelings or hostility:
INOFFENSIVE, INSIPID

(From Webster's Ninth New Colligiate Dictionary.)

5206. Graphics Artist wanted (UK only)

Newsgroup: comp.sys.atari.st
Date: 1994-12-12 23:49:50 UTC
From: popemerlin@delphi.com
Message-ID: <ZE13WHm.popemerlin@delphi.com>
Source record: 174724

I am looking for a graphics artist to design a cover for a new game, any format of file except spectrum 512. If you could snail mail me a sample of your work to this address : PO Box 77, Stroud, Glos, GL6 9YD and include a telephone number or address.

THIS IS FAIRLY URGENT!!! The theme of the cover must bear relation to the mind and can be mono or colour. SO send us your stuff and we will possibly put YOUR name in print.

Cheers

Phineas

I fear we might have a long wait ahead. It looks like it will be 18 months
or so before the PPC standards take solid form as a market product, and
at least another year after that before the prices drop into the home
market range.

Roland.

Richard MORRIS (richard@stingray.manawatu.gen.nz) wrote:
: I was just wondering after seeing all the posts about 040 boards for the
: Falcon...

: Why aren't they making an '060 board for the Falcon instead??? I don't
: know the specs of the '060, but if it's out - why don't companies drop
: any '040 board and work on an '060 board?

A '040 board will definately be cheaper than a '060 board, and thus
appeal to a bigger market.
A '060 board isn't a bad idea, but something that will have to wait for
most developers until thay have made a 040 board.

: I guess that the data lines will probably be 64 bit instead of 32? (This
: is just a presumption). Would that create problems with current Falcons?

No, all 680xx processors have adaptive datawidth. They can accept any
memory size from 8 bit up to 32. (Don't think 060 is 64 bit)

: Or is it that the '060 chip is more expensive than an '040? I don't think
: this would matter as if you are going to buy an accelerator board, surely
: most would go for an '060 as it is bound to be faster than any '040 (unless
: someone made a _serious_ mistake).

Motorola haven't sold so many 060's, (compared to 030-040) and is
probably very expensive compared to them.
060 is faster, but I wouldn't fork out the money for it. To expensive and
I don't need the power.

Regards, Tommy

5209. 2 CD-ROMs to Falcon? DSP-compression??

Newsgroup: comp.sys.atari.st
Date: 1994-12-13 00:54:42 UTC
From: THIETAVUO@FINABO.ABO.FI
Message-ID: <3circi$q4r@josie.abo.fi>
Source record: 174725

Does anyone know, if one can use 2 CD-ROM drives connected to Falcon? Do the driver softwares support it? What problems might occur?

Does Falcon's IDE-bus support CD-ROM drives and over 1/2 Gb hard drives?

Can DSP 56001 be used for such audio-data on-line compression as is used in e.g. Jaguar cartridges? Are such solutions available - and are there any programs existing that could be used as "digital DJ" (capable of playing music from hard disk, preferably in compressed form - and from CD-ROMs too)? Falcon could be an ideal tool for something like that, don't you agree?

Thanks for any help!

Tommi

Yes and no..... The internal DD drive on my ST (very old ST) will quite
happily format HD discs to DD standard, and with no errors at the time of
format and with no loss of data over at least 2 years. The external DD
drive will not format the discs at all without lots of errors. I suppose
it a mix of technical mis-nmatch and good luck!

regards,

Geoff

5213. Nertz over modems

Newsgroup: comp.sys.atari.st
Date: 1994-12-13 02:30:50 UTC
From: trek@intgp4.ih.att.com
Message-ID: <D0q9nE.G0J@ssbunews.ih.att.com>
Source record: 174730

Has anyone out there had any luck getting to play Nertz over the phone lines? My son and I plugged away for a half hour today trying various combinations to get the beast up and running. At the menu the call buttons didn't appear to cause the modem to outpulse (first we booted with modems on, set speed to 2400, selected tone pulsing. My son set up his to dial by editing the first call entry with my number. He put ATDT in the special string. Tried sending ATDT then the number. No pulsing. Then he tried ATDT######## in the special string and that finally outpulsed.

First I tried ATA to get an answer but that didn't work. Next I tried ATS0=1 to get my modem to auto answer but AA light on the modem wouldn't light. After trying several more sequences, it suddenly lite - although I still don't know why it did. With the AA light lit - we did manage to get the two modems squawking at each other but then Nertz wouldn't cut in and take over and cut off the sound from the modems nor go to the main menu. (Maybe I need someone to send me the sound off command?) Seems like Nertz should have cut in but it didn't.

Anyone else have any luck? This was on a pair of Falcons-4.01 at my end, not sure about my sons - I think 4.04. If you have succeeded, please let me know so I can have a chat with you and figure out where our problem is. Thanks, Wayne

5214. Re: Where is Atari ST emulator?

Newsgroup: comp.sys.atari.st
Date: 1994-12-13 03:05:40 UTC
From: darekm@microsoft.com

Source record: 174743

In article <3c7dp8$drt@mercury.dur.ac.uk> L A Boon <L.A.Boon@durham.ac.uk> writes:
> Could anyone tell me where I can find an ATARI ST emulator for my
>PC? As I'd like to be able to play some of my old games but my STs broken.

The Atari ST emulator for PCs, known as Gemulator 3, is not a free product.
You can purchase it from Toad Computers, B & C Computers, Mid Cities
Computers, Rising Star Computers, Run PC, and other Atari dealers in the U.S.
for $99.95. In the U.K. you can purchase it from the Fast Club (a mail order
dealer).

About 3000 Gemulators are currently in use by Atari users all over the world
who made the intelligent choice to buy a real computer rather than waste money
repairing their old Atari computers (which are no longer supported by Atari).

If you need a more complete dealer list or info about either the Atari ST
emulator for DOS or the new Mega STE emulator for Windows, drop a note to
Gemulator's manufacturer:

Branch Always Software
14150 NE 20th St, #302
Bellevue, WA 98007
U.S.A.

and ask for a product catalog. You cal also find reviews of Gemulator in
recent issues of ST Applications, Current Notes, and other magazines.

Sanjay Parker <sxp17@po.CWRU.Edu> writes:

>I hope this isn't old news, but I read on AEO that Atari admitted
>finalizing the deal to license Falcon technology to C-lab. C-Lab makes
>Notator/Logic/Audio sequencing products for most Atari/Apple/PC.

C-lab _used_ to make Notator/Creator as well as Unitor (hardware expander)
and other MIDI products. The company split up, with C-Lab taking over the
hardware and Emagic doing the _software_ and supporting Notator/Creator
as well as developing Notator Logic and porting it to the PC and Mac.

>It seems that they will fix many aesthetic and expandability flaws with the
>Falcon (tower case/detach keyboard; 68040 ; Ram Specs; etc). This is
>obviously an effort to capture a share of the MIDI niche market by C-Lab.
>This could be cool . . .

I have it as inside news that they are considering _two_ case designs and
are like to produce both. One is a present-day Falcon lookalike in a one
piece case, the second is a detached keyboard rack mount unit like the
Wizztronics case. I would recommend that anyone looking for a tower Falcon to
be produced, make their desires known to C-Lab ASAP!!! We have no one but our
selves to blame if we don't provide needed feedback to a company that stands a
real chance to make the next generation TOS machines! I don't have C-Labs
contact info handy - I'll post it later, or look in one of the posted Atari
Developers Lists.

The audio ones or the data ones?

BIG difference! I wouldn't rely on an audio-DAT to backup my data. An AFAIK
some DAT-drives won't work with the audio tapes. The data-tapes come with some
kind of recognition on them.

Worse yet, while Intel wants you to believe it's a single/double precision problem when performing decimal divides, it's equally defective when performing integer manipulations. Even the WINDOZE desktop calculator is smarter than a pentium...

> too).

Last time I checked, the 3D GKS stuff wasn't really up to date, and the
general availability was poor. I'd bet on PEXlib or OpenGL these days.
PEXlib even has something like a free sample implementation with
limited scope which you can build on. Since it's more X-related
than OpenGL, PEXlib on top of Linux or MiNT X seems more feasible.

As for integration into the OS, the difficulities are the same
wherever you go. The 3D library must hook into the window system
someware, and the 2D library is always a separate entity (in most cases:
Xlib), making it harder to mix 2D and 3D graphics in the same window.

> appropriate... now if Atari CAN conform to "standards", thats another issue :-)

Atari hasn't been that bad concerning standards as most people think.
When the ST was released, GEM was about to rule, even in the PC
world, so this actually was a kind of a standard. The DOS filesystem
which TOS uses definitely is a standard, and it has helped us
Atarians a zillion times when transferring data. The ACSI port
is a kludge, but at least it allowed us to connect stock SCSI
disks later, allowing everyone to shop around for the lowest
prices. The same goes for those darn IDE disks in the Falcon 8-)
When the ST was released, both the standard parallel and serial port
were not always common in PCs, you had to add them.

In short, standards avoid adapter kludges and allow you to shop
around and therefore are A Good Thing. OTOH, I'm definitely not
religious about standards. Much of the excitement in the early
Atari days came from being slightly non-standard 8-)

: : I get on my non-scientific digital diary I had handy was something
: : to the effect of 13.2*10^10+ (13.2 * 10 to the power of something
: : larger than 10). If this is true, then I'm not buying a pentium until
: : the P6's come out, by which time I might be able to afford one! :)
^^
That is exactly your problem!
Even knowing that the P5/P54 is somehow buggy you will buy the
next processor from intel.

Why not get a decend processor in a decend computer?

(Well, I think you already have one since you are posting in an atari
group:-)

Greetings.

I've been asked to download some files of the internet for a friend
who has just acquired an old atari st to use with his midi
keyboards. Problem is, I use a PC at work to do all my
downloading!! Is there a program (on the PC of course) anyone
knows of to enable me to format and write to a Atari ST disk??
Also, know any good places for Midi related ST files????

Many thanks in advance.

Pete 'Tinker' Williams
